19.

- a. i) Ovary – releases egg/ female gamete/ ovum  
releases oestrogen/ female hormones (any one)
- ii) Oviduct- Transportation of ovum/ egg from ovary to the uterus/ Site of fertilization
- iii) Uterus – Development of embryo/ foetus
- a) Placenta- It is a disc embedded in uterine wall which contains villi on the embryo side of the tissue and blood space on mother side.  
Function of placenta: Provides nourishment to embryo from mother's blood / Removal of waste from embryo to mother's blood. (Any one)

20.

- a. Defect of vision – Myopia or short sightedness or near sightedness  
Causes of myopia: i) Excessive curvature of eye lens/eye lens becomes more converging  
ii) Elongation of eye ball  
Methods of correction: By the use of concave lens of suitable power or focal length the defect is corrected. / suitable diagrammatic representation.
- b. Due to atmospheric refraction  
The density of different layers of air keeps on changing due to which the apparent image of the stars keeps on changing. This changing position of stars appears as twinkling of stars.

- a. Function of:
- Cornea: focuses light rays / permits the light to enter the eye..
  - Iris: Controls amount of light entering the eye. / controls the size of pupil.
  - Crystalline Lens: Converges light rays onto retina.
  - Ciliary Muscles: Adjusts focal length of eye lens by contraction and relaxation so that sharp image can be obtained on the retina. / helps in accommodation
