## Exercise 9.1

Write the first five terms of each of the sequences in Exercises $\mathbf{1}$ to $\mathbf{6}$ whose nth terms are:

1. $a_{n}=\mathbf{n}(\mathbf{n}+2)$

Solution:
Given,
$\mathrm{n}^{\text {th }}$ term of a sequence $\mathrm{a}_{\mathrm{n}}=\mathrm{n}(\mathrm{n}+2)$
On substituting $n=1,2,3,4$, and 5 , we get the first five terms
$\mathrm{a}_{1}=1(1+2)=3 \mathrm{a}_{2}=2(2+2)=8 \mathrm{a}_{3}=3(3+2)=15 \mathrm{a}_{4}=4(4+$
$2)=24 a_{5}=5(5+2)=35$
Hence, the required terms are $3,8,15,24$, and 35 .
2. $\mathbf{a}_{\mathrm{n}}=\mathbf{n} / \mathbf{n}+\mathbf{1}$

Solution:

Given $\mathrm{n}^{\text {th }}$ term, $\mathrm{a}_{\mathrm{n}}=\mathrm{n} / \mathrm{n}+1$
On substituting $n=1,2,3,4,5$, we get

$$
a_{1}=\frac{1}{1+1}=\frac{1}{2}, a_{2}=\frac{2}{2+1}=\frac{2}{3}, a_{3}=\frac{3}{3+1}=\frac{3}{4}, a_{4}=\frac{4}{4+1}=\frac{4}{5}, a_{5}=\frac{5}{5+1}=\frac{5}{6}
$$

Hence, the required terms are $1 / 2,2 / 3,3 / 4,4 / 5$ and $5 / 6$.
3. $a_{n}=2^{n}$

Solution:

Given $\mathrm{n}^{\text {th }}$ term, $a_{n}=2^{n}$
On substituting $n=1,2,3,4,5$, we get
$\mathrm{a}_{1}=2^{1}=2 \mathrm{a}_{2}=2^{2}=4$
$a_{3}=2^{3}=8 a_{4}=2^{4}=16 a_{5}=2^{5}=32$
Hence, the required terms are $2,4,8,16$, and 32 .

## 4. $\quad a_{n}=(2 n-3) / 6$

## Solution:

Given $\mathrm{n}^{\text {th }}$ term, $a_{n}=(2 \mathrm{n}-3) \mathrm{w} / 6$
On substituting $n=1,2,3,4,5$, we get
$\mathrm{a}_{1}=\frac{2 \times 1-3}{6}=\frac{-1}{6}$
$\mathrm{a}_{2}=\frac{2 \times 2-3}{6}=\frac{1}{6}$
$\mathrm{a}_{3}=\frac{2 \times 3-3}{6}=\frac{3}{6}=\frac{1}{2}$
$\mathrm{a}_{4}=\frac{2 \times 4-3}{6}=\frac{5}{6}$
$\mathrm{a}_{5}=\frac{2 \times 5-3}{6}=\frac{7}{6}$
Hence, the required terms are $-1 / 6,1 / 6,1 / 2,5 / 6$ and $7 / 6$..
5. $a_{n}=(-1)^{\mathrm{n}-1} 5^{\mathrm{n}+1}$

## Solution:

Given $n^{\text {th }}$ term, $\mathrm{a}_{\mathrm{n}}=(-1)^{\mathrm{n}-1} 5^{\mathrm{n}+1}$
On substituting $n=1,2,3,4,5$, we get

$$
\begin{aligned}
& \mathrm{a}_{1}=(-1)^{1-1} 5^{1+1}=5^{2}=25 \\
& \mathrm{a}_{2}=(-1)^{2-1} 5^{2+1}=-5^{3}=-125 \\
& \mathrm{a}_{3}=(-1)^{3-1} 5^{3+1}=5^{4}=625 \\
& \mathrm{a}_{4}=(-1)^{4-1} 5^{4+1}=-5^{5}=-3125 \\
& \mathrm{a}^{5}=(-1)^{5-1} 5^{5+1}=5^{6}=15625
\end{aligned}
$$

Hence, the required terms are $25,-125,625,-3125$, and 15625.

$$
\mathrm{a}_{\mathrm{n}}=\mathrm{n} \frac{\mathrm{n}^{2}+5}{4}
$$

6. 

Solution:

On substituting $n=1,2,3,4,5$, we get first 5 terms
$a_{1}=1 \cdot \frac{1^{2}+5}{4}=\frac{6}{4}=\frac{3}{2}$
$a_{2}=2 \cdot \frac{2^{2}+5}{4}=2 \cdot \frac{9}{4}=\frac{9}{2}$
$a_{3}=3 \cdot \frac{3^{2}+5}{4}=3 \cdot \frac{14}{4}=\frac{21}{2}$
$a_{4}=4 \cdot \frac{4^{2}+5}{4}=21$
$a_{5}=5 \cdot \frac{5^{2}+5}{4}=5 \cdot \frac{30}{4}=\frac{75}{2}$
Hence, the required terms are $3 / 2,9 / 2,21 / 2,21$ and $75 / 2$.
Find the indicated terms in each of the sequences in Exercises $\mathbf{7}$ to $\mathbf{1 0}$ whose $\mathbf{n}^{\text {th }}$ terms are:
7. $\mathbf{a}_{\mathbf{n}}=\mathbf{4 n}-\mathbf{3} ; \mathbf{a}_{17}$,
$\mathbf{a}_{24}$ Solution:

Given,
$n^{\text {th }}$ term of the sequence is $\mathrm{a}_{\mathrm{n}}=4 \mathrm{n}-3$
On substituting $n=17$, we get $\mathrm{a}_{17}=$
$4(17)-3=68-3=65$ Next, on
substituting $n=24$, we get
$\mathrm{a}_{24}=4(24)-3=96-3=93$
8. $\quad a_{n}=n^{2} / 2^{n} ; a^{7}$

## Solution:

Given,
$n^{\text {th }}$ term of the sequence is $\mathrm{a}_{\mathrm{n}}=\mathrm{n}^{2} / 2^{\mathrm{n}}$
Now, on substituting $n=7$, we get a7
$=7^{2} / 2^{7}=49 / 128$
9. $a_{n}=(-1)^{n-1} n^{3}$;
$a_{9}$ Solution:
Given,
$n^{\text {th }}$ term of the sequence is $a_{n}=(-1)^{\mathrm{n}-1} \mathrm{n}^{3}$ On
substituting $n=9$, we get
$\mathrm{a}_{9}=(-1)^{9-1}(9)^{3}=1 \times 729=729$
10. $\mathrm{a}_{\mathrm{n}}=\frac{\mathrm{n}(\mathrm{n}-2)}{\mathrm{n}+3} ; \mathrm{a}_{20}$

NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

## Solution:

On substituting $n=20$, we get
$\mathrm{a}_{20}=\frac{20(20-2)}{20+3}=\frac{20(18)}{23}=\frac{360}{23}$

Write the first five terms of each of the sequences in Exercises 11 to 13 and obtain the corresponding series:
11. $a_{1}=3, a_{n}=3 a_{n-1}+2$ for all $n>1$

Solution:

Given, $\mathrm{a}_{\mathrm{n}}=3 \mathrm{a}_{\mathrm{n}-1}+2$ and $\mathrm{a}_{1}=3$
Then,
$\mathrm{a}_{2}=3 \mathrm{a}_{1}+2=3(3)+2=11$
$\mathrm{a}_{3}=3 \mathrm{a}_{2}+2=3(11)+2=35 \mathrm{a}_{4}$
$=3 \mathrm{a}_{3}+2=3(35)+2=107 \mathrm{a}_{5}$
$=3 \mathrm{a}_{4}+2=3(107)+2=323$
Thus, the first 5 terms of the sequence are $3,11,35,107$ and 323.
Hence, the corresponding series is $3+11+35+107+323$ $\qquad$
12. $a_{1}=-1, a_{n}=a_{n-1} / n, n \geq 2$ Solution:

Given,
$\mathrm{a}_{\mathrm{n}}=\mathrm{a}_{\mathrm{n}-1} / \mathrm{n}$ and $\mathrm{a}_{1}=-1$
Then, $\mathrm{a}_{2}=\mathrm{a}_{1} / 2=-$
$1 / 2 a_{3}=a_{2} / 3=-1 / 6$
$a_{4}=a_{3} / 4=-1 / 24 a_{5}=$
$a_{4} / 5=-1 / 120$
Thus, the first 5 terms of the sequence are $-1,-1 / 2,-1 / 6,-1 / 24$ and $-1 / 120$.
Hence, the corresponding series is
$-1+(-1 / 2)+(-1 / 6)+(-1 / 24)+(-1 / 120)+\ldots \ldots$.
13. $a_{1}=a_{2}=2, a_{n}=a_{n-1}-1, n>2$

Solution:
Given,
$\mathrm{a}_{1}=\mathrm{a}_{2}, \mathrm{a}_{\mathrm{n}}=\mathrm{a}_{\mathrm{n}-1}-1$
Then, $\mathrm{a}_{3}=\mathrm{a}_{2}-1=2$
$-1=1 a_{4}=a_{3}-1=1$
$-1=0 \mathrm{a}_{5}=\mathrm{a}_{4}-1=0$
$-1=-1$
Thus, the first 5 terms of the sequence are $2,2,1,0$ and -1 .

The corresponding series is $2+2+1+0+(-1)+\ldots .$.
14. The Fibonacci sequence is defined by 1 $=a_{1}=a_{2}$ and $a_{n}=a_{n-1}+a_{n-2}, n>2$ Find $\mathbf{a}_{\mathrm{n}+1} / \mathbf{a}_{\mathrm{n}}$, for $\mathrm{n}=1,2,3,4,5$ Solution:

Given, 1
$=\mathrm{a}_{1}=\mathrm{a}_{2}$
$\mathrm{a}_{\mathrm{n}}=\mathrm{an}_{\mathrm{n}}-1+\mathrm{a}_{\mathrm{n}}-2, \mathrm{n}>2$ So,
$\mathrm{a}_{3}=\mathrm{a}_{2}+\mathrm{a}_{1}=1+1=2 \mathrm{a}_{4}$
$=a_{3}+a_{2}=2+1=3 a_{5}=$
$a_{4}+a_{3}=3+2=5$
$a_{6}=a_{5}+a_{4}=5+3=8$
Thus,
For $\mathrm{n}=1, \frac{\mathrm{a}_{\mathrm{n}}+1}{\mathrm{a}_{\mathrm{n}}}=\frac{\mathrm{a}_{2}}{\mathrm{a}_{1}}=\frac{1}{1}=1$
For $\mathrm{n}=2, \frac{\mathrm{a}_{\mathrm{n}}+1}{\mathrm{a}_{\mathrm{n}}}=\frac{\mathrm{a}_{3}}{\mathrm{a}_{2}}=\frac{2}{1}=2$
For $\mathrm{n}=3, \frac{\mathrm{a}_{\mathrm{n}}+1}{\mathrm{a}_{\mathrm{n}}}=\frac{\mathrm{a}_{4}}{\mathrm{a}_{3}}=\frac{3}{2}$
For $\mathrm{n}=4, \frac{\mathrm{a}_{\mathrm{n}}+1}{\mathrm{a}_{\mathrm{n}}}=\frac{\mathrm{a}_{5}}{\mathrm{a}_{4}}=\frac{5}{3}$
For $\mathrm{n}=5, \frac{\mathrm{a}_{\mathrm{n}}+1}{\mathrm{a}_{\mathrm{n}}}=\frac{\mathrm{a}_{6}}{\mathrm{a}_{5}}=\frac{8}{5}$

## Exercise 9.2

1. Find the sum of odd integers from 1 to 2001.

## Solution:

The odd integers from 1 to 2001 are $1,3,5, \ldots 1999,2001$. It clearly forms a sequence in A.P.
Where, the first term, $a=1$
Common difference, $d=2$
Now, $\mathrm{a}+(\mathrm{n}-1) \mathrm{d}=$
$20011+(n-1)(2)=$ 2001
$2 \mathrm{n}-2=20002 \mathrm{n}=$ $2000+2=2002$
$\mathrm{n}=1001 \mathrm{We}$
know,
$\mathrm{S}_{\mathrm{n}}=\mathrm{n} / 2[2 \mathrm{a}+(\mathrm{n}-1) \mathrm{d}]$
$S_{n}=\frac{1001}{2}[2 \times 1+(1001-1) \times 2]$
$=\frac{1001}{2}[2+1000 \times 2]$
$=\frac{1001}{2} \times 2002$
$=1001 \times 1001$
$=1002001$
Therefore, the sum of odd numbers from 1 to 2001 is 1002001 .
2. Find the sum of all natural numbers lying be twe en 100 and 1000 , which are multiples of 5 . Solution:

The natural numbers lying between 100 and 1000 , which are multiples of 5 , are $105,110, \ldots 995$. It clearly forms a sequence in A.P.
Where, the first term, $a=105$
Common difference, $d=5$
Now,
$a+(n-1) d=995105$
$+(n-1)(5)=995$
$105+5 \mathrm{n}-5=9955 \mathrm{n}=$ $995-105+5=895 \mathrm{n}=$ 895/5 n = 179 We know,
$\mathrm{S}_{\mathrm{n}}=\mathrm{n} / 2[2 \mathrm{a}+(\mathrm{n}-1) \mathrm{d}]$

$$
\begin{aligned}
S_{n} & =\frac{179}{2}[2(105)+(179-1)(5)] \\
& =\frac{179}{2}[2(105)+(178)(5)] \\
& =179[105+(89) 5] \\
& =(179)(105+445) \\
& =(179)(550) \\
& =98450
\end{aligned}
$$

Therefore, the sum of all natural numbers lying between 100 and 1000 , which are multiples of 5 , is 98450.
3. In an A.P, the first term is 2 and the sum of the first five terms is one-fourth of the next five terms. Show that $\mathbf{2 0}{ }^{\text {th }}$ term is $\mathbf{- 1 1 2}$. Solution:

Given,
The first term (a) of an A.P $=2$
Let's assume $d$ be the common difference of the A.P.
So, the A.P. will be $2,2+d, 2+2 d, 2+3 d, \ldots$
Then,
Sum of first five terms $=10+10 d$
Sum of next five terms $=10+35 d$
From the question, we have
$10+10 \mathrm{~d}=1 / 4(10+35 \mathrm{~d})$
$40+40 \mathrm{~d}=10+35 \mathrm{~d}$
$30=-5 d$
$\mathrm{d}=-6$
$\mathrm{a}_{20}=\mathrm{a}+(20-1) \mathrm{d}=2+(19)(-6)=2-114=-112$
Therefore, the $20^{\text {th }}$ term of the A.P. is -112 .
4. How many terms of the A.P. $-6,-11 / 2,-5, \ldots$ are needed to give the sum $\mathbf{- 2 5}$ ? Solution:

Let's consider the sum of $n$ terms of the given A.P. as -25 .
We known that,
$\mathrm{S}_{\mathrm{n}}=\mathrm{n} / 2[2 \mathrm{a}+(\mathrm{n}-1) \mathrm{d}]$ where $n=$ number of terms, $a=$ first term, and $d=$ common difference
So here, $a=-6$
$\mathrm{d}=-11 / 2+6=(-11+12) / 2=1 / 2$
Thus, we have

$$
\begin{aligned}
& -25=\frac{n}{2}\left[2 \times(-6)+(n-1)\left(\frac{1}{2}\right)\right] \\
& -50=n\left[-12+\frac{n}{2}-\frac{1}{2}\right] \\
& -50=n\left[-\frac{25}{2}+\frac{n}{2}\right] \\
& -100=n(-25+n) \\
& n^{2}-25 n+100=0 \\
& n^{2}-5 n-20 n+100=0 \\
& n(n-5)-20(n-5)=0 \\
& n=20 \text { or } 5
\end{aligned}
$$

5. In an A.P., if $p^{\text {th }}$ term is $1 / q$ and $q^{\text {th }}$ term is $1 / p$, prove that the sum of first $p q$ terms is $1 / 2$ $(p q+1)$ where $p \neq q$. Solution:

We know that the general term of an A.P is given by: $a_{n}=a+(n-1) d$
From the question. we have
$p^{\text {th }}$ term $=a_{p}=a+(p-1) d=\frac{1}{q}$
$q^{\text {th }}$ term $=a_{q}=a+(q-1) d=\frac{1}{p}$
Subtracting (2) from (1), we have
$(p-1) d-(q-1) d=\frac{1}{q}-\frac{1}{p}$
$(p-1-q+1) d=\frac{p-q}{p q}$
$(p-q) d=\frac{p-q}{p q}$
$d=\frac{1}{p q}$
Using the value of d in (1), we get
$a+(p-1) \frac{1}{p q}=\frac{1}{q}$
$\Rightarrow a=\frac{1}{q}-\frac{1}{q}+\frac{1}{p q}=\frac{1}{p q}$

$$
\begin{aligned}
S_{p q} & =\frac{p q}{2}[2 a+(p q-1) d] \\
& =\frac{p q}{2}\left[\frac{2}{p q}+(p q-1) \frac{1}{p q}\right] \\
& =1+\frac{1}{2}(p q-1) \\
& =\frac{1}{2} p q+1-\frac{1}{2}=\frac{1}{2} p q+\frac{1}{2} \\
& =\frac{1}{2}(p q+1)
\end{aligned}
$$

Therefore, the sum of first pq terms of the A.P is $\frac{1}{2}(p q+1)$
6. If the sum of a certain number of terms of the A.P. $25,22,19, \ldots$ is 116 . Find the last term Solution:

Given A.P., 25,
$22,19, \ldots$
Here,
First term, a = 25 and
Common difference, $d=22-25=-3$
Also given, sum of certain number of terms of the A.P. is 116
The number of terms be $n$
So, we have
$\mathrm{S}_{\mathrm{n}}=\mathrm{n} / 2[2 \mathrm{a}+(\mathrm{n}-1) \mathrm{d}]=116$
$116=\mathrm{n} / 2[2(25)+(\mathrm{n}-1)(-3)]$
$116 \times 2=\mathrm{n}[50-3 \mathrm{n}+3]$
$232=\mathrm{n}[53-3 \mathrm{n}]$
$232=53 n-3 n^{2}$
$3 n^{2}-53 n+232=0$
$3 n^{2}-24 n-29 n+232=0$
$3 \mathrm{n}(\mathrm{n}-8)-29(\mathrm{n}-8)=0$
$(3 n-29)(n-8)=0$
Hence, $\mathrm{n}=29 / 3$
or $\mathrm{n}=8$
As n can only be an integral value, $\mathrm{n}=8$
Thus, $8^{\text {th }}$ term is the last term of the A.P. as
$=25+(8-1)(-3)$
$=25-21$
$=4$

## NCERT Solutions Class 11 Mathematics

 Chapter 9: Sequences and Series7. Find the sum to $\boldsymbol{n}$ terms of the A.P., whose $\boldsymbol{k}^{\text {th }}$ term is $\mathbf{5 k}+1$. Solution:

Given, the $k^{\text {th }}$ term of the A.P. is $5 k+1$.
$k^{\text {th }}$ term $=a_{k}=a+(k-1) d$ And,
$a+(k-1) d=5 k+1 a$
$+k d-d=5 k+1$
On comparing the coefficient of $k$, we get $d=5$
$a-d=1$
$a-5=1$
$\Rightarrow a=6$
$S_{n}=\frac{n}{2}[2 a+(n-1) d]$
$=\frac{n}{2}[2(6)+(n-1)(5)]$
$=\frac{n}{2}[12+5 n-5]$
$=\frac{n}{2}(5 n+7)$
8. If the sum of $\boldsymbol{n}$ terms of an A.P. is $\left(p n+q n^{2}\right)$, where $p$ and $q$ are constants, find the common difference. Solution:

We know that,
$\mathrm{S}_{\mathrm{n}}=\mathrm{n} / 2[2 \mathrm{a}+(\mathrm{n}-1) \mathrm{d}]$
From the question we have,

$$
\begin{aligned}
& \frac{\mathrm{n}}{2}[2 \mathrm{a}+(\mathrm{n}-1) \mathrm{d}]=\mathrm{pn}+\mathrm{qn}^{2} \\
& \frac{\mathrm{n}}{2}[2 \mathrm{a}+\mathrm{nd}-\mathrm{d}]=\mathrm{pn}+\mathrm{qn}^{2} \\
& \mathrm{na}+\mathrm{n}^{2} \frac{\mathrm{~d}}{2}-\mathrm{n} \cdot \frac{\mathrm{~d}}{2}=\mathrm{pn}+\mathrm{qn}^{2}
\end{aligned}
$$

On comparing the coefficients of $n^{2}$ on both sides, we get $\mathrm{d} / 2$ = q
Hence, $d=2 q$
Therefore, the common difference of the A.P. is $2 q$.
9. The sums of $\boldsymbol{n}$ terms of two arithmetic progressions are in the ratio $5 n+4: 9 n+6$. Find the ratio of their $18^{\text {th }}$ terms.
Solution:

## NCERT Solutions Class 11 Mathematics

Chapter 9: Sequences and Series

Let $a_{1}, a_{2}$, and $d_{1}, d_{2}$ be the first terms and the common difference of the first and second arithmetic progression respectively. Then, from the question we have
$\frac{\text { Sum of } n \text { terms of first A.P. }}{\text { Sum of } n \text { terms of second A.P. }}=\frac{5 n+4}{9 n+6}$
$\frac{\frac{n}{2}\left[2 a_{1}+(n-1) d_{1}\right]}{\frac{n}{2}\left[2 a_{2}+(n-1) d_{2}\right]}=\frac{5 n+4}{9 n+6}$
$\frac{2 a_{1}+(n-1) d_{1}}{2 a_{2}+(n-1) d_{2}}=\frac{5 n+4}{9 n+6}$
Substituting $n=35$ in (1), we get
$\frac{2 a_{1}+34 d_{1}}{2 a_{2}+34 d_{2}}=\frac{5(35)+4}{9(35)+6}$
$\frac{a_{1}+17 d_{1}}{a_{2}+17 d_{2}}=\frac{179}{321}$
$\frac{18^{\text {th }} \text { term of first A.P. }}{18^{\text {th }} \text { term of second A.P }}=\frac{a_{1}+17 d_{1}}{a_{2}+17 d_{2}}$
From (2) and (3), we have
$\frac{18^{\text {th }} \text { term of first A.P. }}{18^{\text {th }} \text { term of second A.P. }}=\frac{179}{321}$
Therefore, the ratio of $18^{\text {th }}$ term of both the A.P.s is 179:321.
10. If the sum of first $\boldsymbol{p}$ terms of an A.P. is equal to the sum of the first $\boldsymbol{q}$ terms, then find the sum of the first $(p+q)$ terms.

## Solution:

Let's take $a$ and $d$ to be the first term and the common difference of the A.P. respectively. Then, it given that

## NCERT Solutions Class 11 Mathematics

 Chapter 9: Sequences and Series$$
\begin{aligned}
& S_{p}=\frac{p}{2}[2 a+(p-1) d] \\
& S_{q}=\frac{q}{2}[2 a+(q-1) d]
\end{aligned}
$$

From the question, we have

$$
\begin{align*}
& \frac{p}{2}[2 a+(p-1) d]=\frac{q}{2}[2 a+(q-1) d] \\
& p[2 a+(p-1) d]=q[2 a+(q-1) d] \\
& 2 a p+p d(p-1)=2 a q+q d(q-1) \\
& 2 a(p-q)+d[p(p-1)-q(q-1)]=0 \\
& 2 a(p-q)+d\left[p^{2}-p-q^{2}+q\right]=0 \\
& 2 a(p-q)+d[(p-q)(p+q)-(p-q)]=0 \\
& 2 a(p-q)+d[(p-q)(p+q-1)]=0 \\
& 2 a+d(p+q-1)=0 \\
& \Rightarrow d=\frac{-2 a}{p+q-1} \tag{i}
\end{align*}
$$

So the sum of $(p+q)$ terms will be,

$$
\begin{aligned}
S_{p+q} & =\frac{p+q}{2}[2 a+(p+q-1) \cdot d] \\
S_{p+q} & =\frac{p+q}{2}\left[2 a+(p+q-1)\left(\frac{-2 a}{p+q-1}\right)\right] \quad[\text { From (i) }] \\
& =\frac{p+q}{2}[2 a-2 a] \\
& =0
\end{aligned}
$$

Therefore, the sum of $(p+q)$ terms of the A.P. is 0 .
11. Sum of the first $p, q$ and $r$ terms of an A.P. are $a, b$ and $c$, respectively.

Prove that

$$
\frac{a}{p}(q-r)+\frac{b}{q}(r-p)+\frac{c}{r}(p-q)=0
$$

Solution:

Let $a_{1}$ and $d$ be the first term and the common difference of the A.P. respectively. Then according to the question, we have

$$
\begin{align*}
& S_{p}=\frac{p}{2}\left[2 a_{1}+(p-1) d\right]=a \\
& \Rightarrow 2 a_{1}+(p-1) d=\frac{2 a}{p}  \tag{1}\\
& S_{q}=\frac{q}{2}\left[2 a_{1}+(q-1) d\right]=b \\
& \Rightarrow 2 a_{1}+(q-1) d=\frac{2 b}{q}  \tag{2}\\
& S_{r}=\frac{r}{2}\left[2 a_{1}+(r-1) d\right]=c \\
& \Rightarrow 2 a_{1}+(r-1) d=\frac{2 c}{r} \tag{3}
\end{align*}
$$

Now, subtracting (2) from (1), we get

$$
\begin{align*}
& (p-1) d-(q-1) d=\frac{2 a}{p}-\frac{2 b}{q} \\
& d(p-1-q+1)=\frac{2 a q-2 b p}{p q} \\
& d(p-q)=\frac{2 a q-2 b p}{p a} \\
& d=\frac{2(a q-b p)}{p q(p-q)} \tag{4}
\end{align*}
$$

## NCERT Solutions Class 11 Mathematics

Chapter 9: Sequences and Series

Then, subracting (3) from (2), we get
$(q-1) d-(r-1) d=\frac{2 b}{q}-\frac{2 c}{r}$
$d(q-1-r+1)=\frac{2 b}{q}-\frac{2 c}{r}$
$d(q-r)=\frac{2 b r-2 q c}{q r}$
$d=\frac{2(b r-q c)}{q r(q-r)}$
On equating both the values of $d$ obtained in (4) and (5), we get

$$
\begin{aligned}
& \frac{a q-b p}{p q(p-q)}=\frac{b r-q c}{q r(q-r)} \\
& \quad \frac{a q-b p}{p(p-q)}=\frac{b r-q c}{r(q-r)} \\
& r(q-r)(a q-b p)=p(p-q)(b r-q c) \\
& r(a q-b p)(q-r)=p(b r-q c)(p-q) \\
& (a q r-b p r)(q-r)=(b p r-c p q)(p-q)
\end{aligned}
$$

Dividing both sides by pqr, we have
$\left(\frac{a}{p}-\frac{b}{q}\right)(q-r)=\left(\frac{b}{q}-\frac{c}{r}\right)(p-q)$
$\frac{a}{p}(q-r)-\frac{b}{q}(q-r+p-q)+\frac{c}{r}(p-q)=0$
$\frac{a}{p}(q-r)+\frac{b}{q}(r-p)+\frac{c}{r}(p-q)=0$
Hence, the given result is proved.
12. The ratio of the sums of $m$ and $n$ terms of an A.P. is $m^{2}: n^{2}$. Show that the ratio of $m^{\text {th }}$ and $n^{\text {th }}$ term is ( $2 m-1$ ): $(2 n-1)$. Solution:

Let's consider that $a$ and $b$ to be the first term and the common difference of the A.P. respectively. Then from the question, we have

$$
\begin{aligned}
& \frac{\text { Sum of } m \text { terms }}{\text { Sum of } n \text { terms }}=\frac{m^{2}}{n^{2}} \\
& \frac{\frac{m}{2}[2 a+(m-1) d]}{\frac{n}{2}[2 a+(n-1) d]}=\frac{m^{2}}{n^{2}}
\end{aligned}
$$

$$
\begin{equation*}
\frac{2 \mathrm{a}+(\mathrm{m}-1) \mathrm{d}}{2 \mathrm{a}+(\mathrm{n}-1) \mathrm{d}}=\frac{\mathrm{m}}{\mathrm{n}} \tag{1}
\end{equation*}
$$

Putting $m=2 m-1$ and $n=2 n-1$ in (1), we get
$\frac{2 a+(2 m-2) d}{2 a+(2 n-2) d}=\frac{2 m-1}{2 n-1}$
$\Rightarrow \frac{\mathrm{a}+(\mathrm{m}-1) \mathrm{d}}{\mathrm{a}+(\mathrm{n}-1) \mathrm{d}}=\frac{2 \mathrm{~m}-1}{2 \mathrm{n}-1}$
Now,
$\frac{\mathrm{m}^{\text {th }} \text { term of A.P. }}{\mathrm{n}^{\text {th }} \text { term of A.P. }}=\frac{a+(m-1) \mathrm{d}}{a+(n-1) \mathrm{d}}$
From (2) and (3), we have
$\frac{\mathrm{m}^{\text {th }} \text { term of A.P }}{\mathrm{n}^{\text {th }} \text { term of A.P }}=\frac{2 \mathrm{~m}-1}{2 \mathrm{n}-1}$
Hence, the given result is proved.
13. If the sum of $\boldsymbol{n}$ terms of an A.P. is $3 n^{2}+5 n$ and its $m^{\text {th }}$ term is 164 , find the value of $m$. Solution:

Let's consider $a$ and $b$ to be the first term and the common difference of the A.P. respectively.
$a_{m}=a+(m-1) d=164 \ldots$ (1) We
the sum of the terms is given by,
$\mathrm{S}_{\mathrm{n}}=\mathrm{n} / 2[2 \mathrm{a}+(\mathrm{n}-1) \mathrm{d}]$

$$
\begin{aligned}
& \frac{n}{2}[2 a+n d-d]=3 n^{2}+5 n \\
& n a+\frac{d}{2} n^{2}-\frac{d}{2} n=3 n^{2}+5 n \\
& \frac{d}{2} n^{2}+\left(a-\frac{d}{2}\right) n=3 n^{2}+5 n
\end{aligned}
$$

On comparing the coefficient of $\mathrm{n}^{2}$ on both sides, we get $\frac{d}{2}=3$
$\Rightarrow d=6$
On comparing the coefficient of n on both sides, we get
$a-\frac{d}{2}=5$
$a-3=5$
$a=8$
Hence, from (1), we get
$8+(m-1) 6=164$
$(m-1) 6=164-8=156$
$m-1=26$
$m=27$
Therefore, the value of m is 27 .

## NCERT Solutions Class 11 Mathematics

Chapter 9: Sequences and Series
14. Insert five numbers between 8 and 26 such that the resulting sequence is an A.P. Solution:

Let's assume $\mathrm{A}_{1}, \mathrm{~A}_{2}, \mathrm{~A}_{3}, \mathrm{~A}_{4}$, and $\mathrm{A}_{5}$ to be five numbers between 8 and 26 such that $8, \mathrm{~A}_{1}, \mathrm{~A}_{2}, \mathrm{~A}_{3}, \mathrm{~A}_{4}$, $\mathrm{A}_{5}, 26$ are in an A.P. Here we have, $a=8, b=26, n=7$
So,
$26=8+(7-1) d 6 d$
$=26-8=18$
$d=3$
Now,
$\mathrm{A}_{1}=a+d=8+3=11$
$\mathrm{A}_{2}=a+2 d=8+2 \times 3=8+6=14$
$\mathrm{A}_{3}=a+3 d=8+3 \times 3=8+9=17$
$\mathrm{A}_{4}=a+4 d=8+4 \times 3=8+12=20$
$\mathrm{A}_{5}=a+5 d=8+5 \times 3=8+15=23$
Therefore, the required five numbers between 8 and 26 are $11,14,17,20$, and 23 .
15. If $\frac{a^{n}+b^{n}}{a^{n-1}+b^{n-1}}$ is the A.M. between $\boldsymbol{a}$ and $\boldsymbol{b}$, then find the value of $\boldsymbol{n}$. Solution:

The A.M between $a$ and $b$ is given $b y,(a+b) / 2$ Then
according to the question,

$$
\begin{aligned}
& \frac{a+b}{2}=\frac{a^{n}+b^{n}}{a^{n-1}+b^{n-1}} \\
& (a+b)\left(a^{n-1}+b^{n-1}\right)=2\left(a^{n}+b^{n}\right) \\
& a^{n}+a b^{n-1}+b a^{n-1}+b^{n}=2 a^{n}+2 b^{n} \\
& a b^{n-1}+a^{n-1} b=a^{n}+b^{n} \\
& a b^{n-1}-b^{n}=a^{n}-a^{n-1} b \\
& b^{n-1}(a-b)=a^{n-1}(a-b) \\
& b^{n-1}=a^{n-1} \\
& \left(\frac{a}{b}\right)^{n-1}=1=\left(\frac{a}{b}\right)^{0} \\
& n-1=0 \\
& n=1
\end{aligned}
$$

Thus, the value of n is 1 .
16. Between 1 and $31, m$ numbers have been inserted in such a way that the resulting sequence is an A.P. and the ratio of $7^{\text {th }}$ and $(m-1)^{\text {th }}$ numbers is 5: 9. Find the value of $m$.
Solution:

Let's consider $\mathrm{a}_{1}, \mathrm{a}_{2}, \ldots \mathrm{a}_{m}$ be $m$ numbers such that $1, \mathrm{a}_{1}, \mathrm{a}_{2}, \ldots \mathrm{a}_{m}, 31$ is an A.P.
And here, $a=1, b=31, n=$
$m+2$ So, $31=1+(m+2-$

1) (d)
$30=(m+1) d$
$\mathrm{d}=30 /(\mathrm{m}+1) \ldots \ldots$ (1) Now,
$\mathrm{a}_{1}=a+d \mathrm{a}_{2}=a+$
$2 d \mathrm{a}_{3}=a+3 d \ldots$
Hence, $\mathrm{a}_{7}=a+7 d$
$\mathrm{a}_{m-1}=a+(m-1) d$
According to the question, we have
$\frac{a+7 d}{a+(m-1) d}=\frac{5}{9}$
$\frac{1+7\left(\frac{30}{(m+1)}\right)}{1+(m-1)\left(\frac{30}{m+1}\right)}=\frac{5}{9}$
[From (1)]
$\frac{m+1+7(30)}{m+1+30(m-1)}=\frac{5}{9}$
$\frac{m+1+210}{m+1+30 m-30}=\frac{5}{9}$
$\frac{m+211}{31 m-29}=\frac{5}{9}$
$9 m+1899=155 m-145$
$155 m-9 m=1899+145$
$146 m=2044$
$m=14$
Therefore, the value of $m$ is 14 .
17. A man starts repaying a loan as first instalment of Rs. 100 . If he increases the instalment by Rs 5 every month, what amount he will pay in the $30^{\text {th }}$ instalment? Solution:

Given,
The first instalment of the loan is Rs 100 .
The second instalment of the loan is Rs 105 and so on as the instalment increases by Rs 5 every month. Thus, the amount that the man repays every month forms an A.P.
And the, A.P. is $100,105,110, \ldots$
Where, first term, $a=100$

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

Common difference, $d=5$
So, the $30^{\text {th }}$ term in this A.P. will be

$$
\begin{aligned}
\mathrm{A}_{30} & =a+(30-1) d \\
& =100+(29)(5) \\
& =100+145 \\
& =245
\end{aligned}
$$

Therefore, the amount to be paid in the $30^{\text {th }}$ instalment will be Rs 245 .
18. The difference between any two consecutive interior angles of a polygon is $5^{\circ}$. If the smallest angle is $120^{\circ}$, find the number of the sides of the polygon.
Solution:

It's understood from the question that, the angles of the polygon will form an A.P. with common difference $d=5^{\circ}$ and first term $a=120^{\circ}$.
And, we know that the sum of all angles of a polygon with $n$ sides is $180^{\circ}(n-2)$. Thus, we can say
$S_{n}=180^{\circ}(n-2)$
$\frac{n}{2}[2 a+(n-1) d]=180^{\circ}(n-2)$
$\frac{n}{2}\left[240^{\circ}+(n-1) 5^{\circ}\right]=180(n-2)$
$n[240+(n-1) 5]=360(n-2)$
$240 n+5 n^{2}-5 n=360 n-720$
$5 n^{2}+235 n-360 n+720=0$
$5 n^{2}-125 n+720=0$
$n^{2}-25 n+144=0$
$n^{2}-16 n-9 n+144=0$
$n(n-16)-9(n-16)=0$
$(n-9)(n-16)=0$
$n=9$ or 16
Thus, a polygon having 9 and 16 sides will satisfy the condition in the question.

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

## Exercise 9.3

1. Find the $20^{\text {th }}$ and $\boldsymbol{n}^{\text {th }}$ terms of the G.P. 5/2, 5/4, 5/8, $\qquad$ Solution:

Given G.P. is $5 / 2,5 / 4,5 / 8, \ldots \ldots .$. Here,
$a=$ First term $=5 / 2$
$r=$ Common ratio $=(5 / 4) /(5 / 2)=1 / 2$
Thus, the $20^{\text {th }}$ term and $\mathrm{n}^{\text {th }}$ term
$a_{20}=a r^{20-1}=\frac{5}{2}\left(\frac{1}{2}\right)^{19}=\frac{5}{(2)(2)^{19}}=\frac{5}{(2)^{20}}$
$a_{n}=a r^{n-1}=\frac{5}{2}\left(\frac{1}{2}\right)^{n-1}=\frac{5}{(2)(2)^{n-1}}=\frac{5}{(2)^{n}}$
2. Find the $12^{\text {th }}$ term of a G.P. whose $8^{\text {th }}$ term is $\mathbf{1 9 2}$ and the common ratio is $\mathbf{2}$. Solution:

Given,
The common ratio of the G.P., $r=2$ And, let $a$ be the first term of the G.P.
Now,
$a_{8}=a r^{8-1}=a r^{7}$
$a r^{7}=192 a(2)^{7}$
$=192 a(2)^{7}=$
(2) ${ }^{6}$ (3)

So,

$$
a=\frac{(2)^{6} \times 3}{(2)^{7}}=\frac{3}{2}
$$

Hence,

$$
a_{12}=a r^{12-1}=\left(\frac{3}{2}\right)(2)^{11}=(3)(2)^{10}=3072
$$

3. The $5^{\text {th }}, 8^{\text {th }}$ and $11^{\text {th }}$ terms of a G.P. are $p, q$ and $s$, respectively. Show that $q^{\mathbf{2}}=p s$. Solution:

Let's take $a$ to be the first term and $r$ to be the common ratio of the G.P. Then according to the question, we have
$a_{5}=a r^{5-1}=a \mathrm{r}^{4}=p \ldots$ (i) $a_{8}=a r^{8-}$
${ }^{1}=a r^{7}=q \ldots$ (ii) $a_{11}=\mathrm{a} r^{11-1}=a$
$r^{10}=s \ldots$ (iii) Dividing equation
(ii) by (i), we get

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

$$
\begin{align*}
& \frac{a r^{7}}{a r^{4}}=\frac{q}{p} \\
& r^{3}=\frac{q}{p} \tag{iv}
\end{align*}
$$

On dividing equation (iii) by (ii), we get

$$
\begin{align*}
\frac{a r^{10}}{a r^{7}} & =\frac{s}{q} \\
r^{3} & =\frac{s}{q} \tag{v}
\end{align*}
$$

Equating the values of $\mathrm{r}^{3}$ obtained in (iv) and (v), we get

$$
\begin{aligned}
& \frac{q}{p}=\frac{s}{q} \\
& \quad q^{2}=p s
\end{aligned}
$$

Hence proved.
4. The $4^{\text {th }}$ term of a G.P. is square of its second term, and the first term is $\mathbf{- 3}$. Determine its $7^{\text {th }}$ term. Solution:

Let's consider $a$ to be the first term and $r$ to be the common ratio of the G.P.
Given, $a=-3$ And
we know that, $a_{n}$
= $a_{n-1}$
So, $a_{4}=a r^{3}=(-3) r^{3} a_{2}$
$=a r^{1}=(-3) r$
Then from the question, we have
$(-3) r^{3}=[(-3) r]^{2}$
$\Rightarrow-3 r^{3}=9 r^{2}$
$\Rightarrow \quad r=-3$
$a_{7}=a r^{7-1}=a r^{6}=(-3)(-3)^{6}=-(3)^{7}=-2187$ Therefore,
the seventh term of the G.P. is -2187 .
5. Which term of the following sequences:
(a) $2,2 \sqrt{ } 2,4, \ldots$ is 128 ?
(b) $\sqrt{ } 3,3,3 \sqrt{ } 3, \ldots$ is 729 ?
(c) $1 / 3,1 / 9,1 / 27, \ldots$ is $1 / 19683$ ? Solution:
(a) The given sequence, $2,2 \sqrt{ } 2,4, \ldots$

We have, $\mathrm{a}=2$ and $\mathrm{r}=$
$2 \sqrt{ } 2 / 2=\sqrt{ } 2$
Taking the $\mathrm{n}^{\text {th }}$ term of this sequence as 128 , we have

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

$$
\begin{aligned}
& a_{n}=a r^{n-1} \\
& (2)(\sqrt{2})^{n-1}=128 \\
& (2)(2)^{\frac{n-1}{2}}=(2)^{7} \\
& (2)^{\frac{n-1}{2}+1}=(2)^{7} \\
& \frac{n-1}{2}+1=7 \\
& \frac{n-1}{2}=6 \\
& n-1=12 \\
& n=13
\end{aligned}
$$

Therefore, the $13^{\text {th }}$ term of the given sequence is 128 .
(ii) Given sequence, $\sqrt{ } 3,3,3 \sqrt{ } 3, \ldots$

We have, $a=\sqrt{ } 3$ and $r$
$=3 / \sqrt{ } 3=\sqrt{ } 3$
Taking the $\mathrm{n}^{\text {th }}$ term of this sequence to be 729 , we have
$a_{n}=a r^{n-1}$
$\therefore a r^{n-1}=729$
$(\sqrt{3})(\sqrt{3})^{n-1}=729$
$(3)^{\frac{1}{2}}(3)^{\frac{n-1}{2}}=(3)^{6}$
(3) $)^{\frac{1}{2} \frac{n-1}{2}}=(3)^{6}$

Equating the exponents, we have

$$
\begin{aligned}
& \frac{1}{2}+\frac{n-1}{2}=6 \\
& \frac{1+n-1}{2}=6
\end{aligned}
$$

$\therefore n=12$
Therefore, the $12^{\text {th }}$ term of the given sequence is 729 .
(iii) Given sequence, $1 / 3,1 / 9,1 / 27, \ldots \mathrm{a}=1 / 3$ and $\mathrm{r}=(1 / 9) /(1 / 3)=$ 1/3
Taking the $\mathrm{n}^{\text {th }}$ term of this sequence to be $1 / 19683$, we have

$$
\begin{aligned}
& a_{n}=a r^{n-1} \\
& \therefore a r^{n-1}=\frac{1}{19683} \\
& \left(\frac{1}{3}\right)\left(\frac{1}{3}\right)^{n-1}=\frac{1}{19683} \\
& \left(\frac{1}{3}\right)^{n}=\left(\frac{1}{3}\right)^{9} \\
& n=9
\end{aligned}
$$

Therefore, the $9^{\text {th }}$ term of the given sequence is $1 / 19683$.
6. For what values of $x$, the numbers $-2 / 7, \mathrm{x},-7 / 2$ are in G.P?

Solution:

The given numbers are $-2 / 7, x,-7 / 2$. Common
ratio $=x /(-2 / 7)=-7 x / 2$
Also, common ratio $=(-7 / 2) / x=-7 / 2 x$
$\therefore \frac{-7 \mathrm{x}}{2}=\frac{-7}{2 \mathrm{x}}$
$\mathrm{x}^{2}=\frac{-2 \times 7}{-2 \times 7}=1$
$x=\sqrt{1}$
$\mathrm{x}= \pm 1$
Therefore, for $x= \pm 1$, the given numbers will be in G.P.
7. Find the sum to 20 terms in the geometric progression $0.15,0.015,0.0015 \ldots$ Solution:

Given G.P., $0.15,0.015,0.00015, \ldots$
Here, $a=0.15$ and $\mathrm{r}=0.015 / 0.15=0.1$

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

$$
\begin{aligned}
& \text { We know that, } \mathrm{S}_{\mathrm{n}}=\frac{\mathrm{a}\left(1-\mathrm{r}^{\mathrm{n}}\right)}{1-\mathrm{r}} \\
& \begin{aligned}
\begin{aligned}
\mathrm{S}_{20} & =\frac{0.15\left[1-(0.1)^{20}\right]}{1-0.1} \\
& =\frac{0.15}{0.9}\left[1-(0.1)^{20}\right] \\
& =\frac{15}{90}\left[1-(0.1)^{20}\right] \\
& =\frac{1}{6}\left[1-(0.1)^{20}\right]
\end{aligned}
\end{aligned}>.
\end{aligned}
$$

8. Find the sum to $\boldsymbol{n}$ terms in the geometric progression $\sqrt{ } 7, \sqrt{ } 21,3 \sqrt{ } 7, \ldots$. Solution:

The given G.P is $\sqrt{ } 7, \sqrt{ } 21,3 \sqrt{ } 7, \ldots$
Here, $\mathrm{a}=$
$\sqrt{ } 7$ and
$\mathrm{r}=\frac{\sqrt{21}}{\sqrt{7}}=\sqrt{3}$
$S_{n}=\frac{a\left(1-r^{n}\right)}{1-r}$
$\therefore S_{n}=\frac{\sqrt{7}\left[1-(\sqrt{3})^{n}\right]}{1-\sqrt{3}}$
$\begin{aligned}= & \frac{\sqrt{7}\left[1-(\sqrt{3})^{n}\right]}{1-\sqrt{3}} \times \frac{1+\sqrt{3}}{1+\sqrt{3}} \\ = & \frac{\sqrt{7}(1+\sqrt{3})\left[1-(\sqrt{3})^{n}\right]}{1-3}\end{aligned}$
$=\frac{-\sqrt{7}(1+\sqrt{3})}{2}\left[1-(3)^{\frac{n}{2}}\right]$
$=\frac{\sqrt{7}(1+\sqrt{3})}{2}\left[(3)^{\frac{n}{2}}-1\right]$
(By rationalizing)
9. Find the sum to $n$ terms in the geometric progression $1,-\mathbf{a}, \mathbf{a}^{2},-\mathbf{a}^{3} \ldots$. (if $\mathbf{a} \neq-\mathbf{1}$ ) Solution:

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

The given G.P. is $1,-a, a^{2},-a^{3} \ldots$
Here, the first term $=a_{1}=1$
And the common ratio $=r=-a$
We know that,
$S_{n}=\frac{a_{1}\left(1-r^{n}\right)}{1-r}$
$\therefore S_{n}=\frac{1\left[1-(-a)^{n}\right]}{1-(-a)}=\frac{\left[1-(-a)^{n}\right]}{1+a}$
10. Find the sum to $\boldsymbol{n}$ terms in the geometric progression $x^{3}, x^{5}, x^{7}, \ldots$ (if $x \neq \pm 1$ ) Solution:

Given G.P. is $\mathrm{x}^{3}, \mathrm{x}^{5}, \mathrm{x}^{7}, \ldots$
Here, we have $a=x^{3}$ and $r=x^{5} / \mathrm{x}^{3}=\mathrm{x}^{2}$
We know that, $S_{n}=\frac{a\left(1-r^{n}\right)}{1-r}$

$$
S_{n}=\frac{a\left(1-r^{n}\right)}{1-r}=\frac{x^{3}\left[1-\left(x^{2}\right)^{n}\right]}{1-x^{2}}=\frac{x^{3}\left(1-x^{2 n}\right)}{1-x^{2}}
$$

11. Evaluate: $\sum_{k=1}^{11}\left(2+3^{k}\right)$

Solution:

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

$\sum_{k=1}^{11}\left(2+3^{k}\right)=\sum_{k=1}^{11}(2)+\sum_{k=1}^{11} 3^{k}=2(11)+\sum_{k=1}^{11} 3^{k}=22+\sum_{k=1}^{11} 3^{k}$
$\sum_{k=1}^{11} 3^{k}=3^{1}+3^{2}+3^{3}+\ldots+3^{11}$
We can see that, the terms of this sequence $3,3^{2}, 3^{3}, \ldots$ forms a G.P
And, we know
$\mathrm{S}_{\mathrm{n}}=\frac{\mathrm{a}\left(\mathrm{r}^{\mathrm{n}}-1\right)}{\mathrm{r}-1}$
$\mathrm{S}_{11}=\frac{3\left[(3)^{11}-1\right]}{3-1}$
$\mathrm{S}_{11}=\frac{3}{2}\left(3^{11}-1\right)$
$\therefore \sum_{k=1}^{11} 3^{k}=\frac{3}{2}\left(3^{11}-1\right)$
On substituting the above value in equation (1), we get
$\sum_{k=1}^{11}\left(2+3^{k}\right)=22+\frac{3}{2}\left(3^{11}-1\right)$
12. The sum of first three terms of a G.P. is $\mathbf{3 9 / 1 0}$ and their product is $\mathbf{1}$. Find the common ratio and the terms. Solution:

Let $\mathrm{a} / \mathrm{r}$, a , ar be the first three terms of the G.P.
$a / r+a+a r=39 / 10$
(a/r) (a) (ar)=1 (2) From
(2), we have
$\mathrm{a}^{3}=1$
Hence, $\mathrm{a}=1$ [Considering real roots only]
Substituting the value of a in (1), we get
$1 / r+1+r=39 / 10$
$\left(1+r+r^{2}\right) / r=39 / 10$
$10+10 r+10 r^{2}=39 r$
$10 \mathrm{r}^{2}-29 \mathrm{r}+10=0$
$10 r^{2}-25 r-4 r+10=0$
$5 r(2 r-5)-2(2 r-5)=0$
$(5 r-2)(2 r-5)=0$
Thus, $\mathrm{r}=$
$2 / 5$ or $5 / 2$
Therefore, the three terms of the G.P. are $5 / 2,1$ and $2 / 5$.

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

13. How many terms of G.P. $3, \mathbf{3}^{2}, 3^{3}, \ldots$ are needed to give the sum 120 ? Solution:

Given G.P. is $3,3^{2}, 3^{3}, \ldots$
Let's consider that $n$ terms of this G.P. be required to obtain the sum of 120 .
We know that,

$$
S_{n}=\frac{a\left(r^{n}-1\right)}{r-1}
$$

Here, $a=3$ and $r=3$

$$
\begin{aligned}
& S_{n}=120=\frac{3\left(3^{n}-1\right)}{3-1} \\
& 120=\frac{3\left(3^{n}-1\right)}{2} \\
& \frac{120 \times 2}{3}=3^{n}-1 \\
& 3^{n}-1=80 \\
& 3^{n}=81 \\
& 3^{n}=3^{4}
\end{aligned}
$$

Equating the exponents we get, $n=4$
Therefore, four terms of the given G.P. are required to obtain the sum as 120 .
14. The sum of first three terms of a G.P. is $\mathbf{1 6}$ and the sum of the next three terms is 128. Determine the first term, the common ratio and the sum to $\boldsymbol{n}$ terms of the G.P. Solution:

Let's assume the G.P. to be $a, a r, a r^{2}, a r^{3}, \ldots$ Then according to the question, we have $a+$ $a r+a r^{2}=16$ and $a r^{3}+a r^{4}+a r^{5}=128 a(1+$ $\left.r+r^{2}\right)=16 \ldots$ (1) and,
$a r^{3}\left(1+r+r^{2}\right)=128 \ldots$ (2) Dividing
equation (2) by (1), we get
$\frac{a r^{3}\left(1+r+r^{2}\right)}{a\left(1+r+r^{2}\right)}=\frac{128}{16}$
$\mathrm{r}^{3}=8$
$\mathrm{r}=2$
Now, using $r=2$ in (1), we get
$\mathrm{a}(1+2+4)=16$
$a(7)=16 \quad a=16 / 7$
Now, the sum of terms is given as

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

$S_{n}=\frac{a\left(r^{n}-1\right)}{r-1}$
$\Rightarrow S_{n}=\frac{16}{7} \frac{\left(2^{n}-1\right)}{2-1}=\frac{16}{7}\left(2^{n}-1\right)$
15. Given a G.P. with $a=729$ and $7^{\text {th }}$ term 64, determine $S_{7}$.

Solution:

Given, $a=729$ and
$a_{7}=64$
Let $r$ be the common ratio of the G.P. Then
we know that, $a_{n}=a r^{n-1}$

$$
\begin{aligned}
& \quad 7=a r^{7-1}=(729) r^{6} a \\
& \Rightarrow 64=729 r \\
& r^{6}=64 / 729 r^{6} \\
& =(2 / 3)^{6} \\
& r=2 / 3
\end{aligned}
$$

And, we know that

$$
S_{n}=\frac{a\left(1-r^{n}\right)}{1-r}
$$

$S_{7}=\frac{729\left[1-\left(\frac{2}{3}\right)^{7}\right]}{1-\frac{2}{3}}$

$$
=3 \times 729\left[1-\left(\frac{2}{3}\right)^{7}\right]
$$

$$
=(3)^{7}\left[\frac{(3)^{7}-(2)^{7}}{(3)^{7}}\right]
$$

$$
=3^{7}-2^{7}
$$

$$
=2187-128
$$

$$
=2059
$$

16. Find a G.P. for which sum of the first two terms is $\mathbf{- 4}$ and the fifth term is $\mathbf{4}$ times the third term. Solution:

Consider $a$ to be the first term and $r$ to be the common ratio of the G.P.
Given, $S_{2}=-4$

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

Then, from the question we have

$$
\begin{equation*}
S_{2}=-4=\frac{a\left(1-r^{2}\right)}{1-r} \tag{1}
\end{equation*}
$$

And, $\mathrm{a}_{5}=$
$4 \times$ a $_{3} a r^{4}$
$=4 \mathrm{ar}^{2} \mathrm{r}^{2}$
$=4 \mathrm{r}= \pm$
2
Using the value of $r$ in (1), we have

$$
\begin{aligned}
& -4=\frac{a\left[1-(2)^{2}\right]}{1-2} \text { for } r=2 \\
& -4=\frac{a(1-4)}{-1} \\
& -4=a(3) \\
& a=\frac{-4}{3} \\
& \text { Also, }-4=\frac{a\left[1-(-2)^{2}\right]}{1-(-2)} \text { for } r=-2 \\
& -4=\frac{a(1-4)}{1+2} \\
& -4=\frac{a(-3)}{3} \\
& a=4
\end{aligned}
$$

Therefore, the required G.P is
$-4 / 3,-8 / 3,-16 / 3, \ldots$ Or $4,-8,16,-32, \ldots \ldots$
17. If the $4^{\text {th }}, 10^{\text {th }}$ and $16^{\text {th }}$ terms of a G.P. are $x, y$ and $z$, respectively. Prove that $x, y, z$ are in G.P. Solution:

Let $a$ be the first term and $r$ be the common ratio of the G.P.
According to the given condition, $a_{4}=a r^{3}=x$
$a_{10}=a r^{9}=y \ldots$ (2) $a_{16}$
$=a r^{15}=z \ldots$ (3)
On dividing (2) by (1), we get

## NCERT Solutions Class 11 Mathematics

 Chapter 9: Sequences and Series$$
\frac{y}{x}=\frac{a r^{9}}{a r^{3}} \Rightarrow \frac{y}{x}=r^{6}
$$

And, on dividing (3) by (2), we get

$$
\begin{aligned}
& \frac{z}{y}=\frac{a r^{15}}{a r^{9}} \Rightarrow \frac{z}{y}=r^{6} \\
& \frac{y}{x}=\frac{z}{y}
\end{aligned}
$$

Therefore, $x, y, z$ are in G. P.

Given sequence: $8,88,888,8888 \ldots$ This
sequence is not a G.P.
But, it can be changed to G.P. by writing the terms as
$S_{n}=8+88+888+8888+\ldots \ldots \ldots \ldots \ldots$. to $n$ terms

$$
\begin{aligned}
& =\frac{8}{9}[9+99+999+9999+\ldots \ldots \ldots . . . \text { to } n \text { terms }] \\
& =\frac{8}{9}\left[(10-1)+\left(10^{2}-1\right)+\left(10^{3}-1\right)+\left(10^{4}-1\right)+\ldots \ldots . . \text { to } n \text { terms }\right] \\
& =\frac{8}{9}\left[\left(10+10^{2}+\ldots \ldots . n \text { terms }\right)-(1+1+1+\ldots . n \text { terms })\right] \\
& =\frac{8}{9}\left[\frac{10\left(10^{n}-1\right)}{10-1}-n\right] \\
& =\frac{8}{9}\left[\frac{10\left(10^{n}-1\right)}{9}-n\right] \\
& =\frac{80}{81}\left(10^{n}-1\right)-\frac{8}{9} n
\end{aligned}
$$

19. Find the sum of the products of the corresponding terms of the sequences $2,4,8,16,32$ and 128, 32, 8, 2, 1/2.
Solution:

The required sum $=2 \times 128+4 \times 32+8 \times 8+16 \times 2+32 \times 1 / 2$

$$
=64\left[4+2+1+1 / 2+1 / 2^{2}\right] \text { Now, }
$$

it's seen that
$4,2,1,1 / 2,1 / 2^{2}$ is a G.P.
With first term, $a=4$
Common ratio, $r=1 / 2$

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

We know,

$$
\begin{aligned}
& \mathrm{S}_{\mathrm{n}}=\frac{\mathrm{a}\left(1-\mathrm{r}^{\mathrm{n}}\right)}{1-\mathrm{r}} \\
& \therefore \mathrm{~S}_{5}=\frac{4\left[1-\left(\frac{1}{2}\right)^{5}\right]}{1-\frac{1}{2}}=\frac{4\left[1-\frac{1}{32}\right]}{\frac{1}{2}}=8\left(\frac{32-1}{32}\right)=\frac{31}{4}
\end{aligned}
$$

Therefore, the required sum $=64(31 / 4)=(16)(31)=496$
20. Show that the products of the corresponding terms of the sequences $a, \operatorname{ar}^{2} \operatorname{ar}^{2}, \ldots r^{n-1}$ and $A$, AR, $A R^{2}, \ldots A R^{n-1}$ form a G.P, and find the common ratio. Solution:

To be proved: The sequence, $a A, a r A R, a r^{2} A R^{2}, \ldots a r^{n-1} A R^{n-1}$, forms a G.P.
Now, we have

$$
\begin{aligned}
& \frac{\text { Second term }}{\text { First term }}=\frac{a r A R}{a A}=r R \\
& \frac{\text { Third term }}{\text { Second term }}=\frac{a r^{2} A R^{2}}{a r A R}=r R
\end{aligned}
$$

Therefore, the above sequence forms a G.P. and the common ratio is $r R$.
21. Find four numbers forming a geometric progression in which third term is greater than the first term by 9 , and the second term is greater than the $4^{\text {th }}$ by 18 . Solution:

Consider $a$ to be the first term and $r$ to be the common ratio of the G.P.
Then,
$a_{1}=a, a_{2}=a r, a_{3}=a r^{2}, a_{4}=a r^{3}$ From
the question, we have
$a_{3}=a_{1}+9 a r^{2}=a+9$
... (i) $a_{2}=a_{4}+18 a r=a r^{3}$
+18 ... (ii) So, from (1)
and (2), we get $a\left(r^{2}-1\right)=$
$9 \ldots$ (iii) $\operatorname{ar}\left(1-r^{2}\right)=18 \ldots$
(iv)

Now, dividing (4) by (3), we get
$\frac{a r\left(1-r^{2}\right)}{a\left(r^{2}-1\right)}=\frac{18}{9}$
$-r=2$
$r=-2$
On substituting the value of $r$ in (i), we get

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

$$
\begin{aligned}
& 4 a=a+9 \\
& 3 a=9 \therefore \\
& a=3
\end{aligned}
$$

Therefore, the first four numbers of the G.P. are $3,3(-2), 3(-2)^{2}$, and $3(-2)^{3}$ i.e., $3,-6,12$, and -24 .
22. If the $\mathbf{p}^{\text {th }}, q^{\text {th }}$ and $\mathbf{r}^{\text {th }}$ terms of a G.P. are $a, b$ and $c$, respectively. Prove that $\mathbf{a}^{q-r} \mathbf{b}^{r-p} \mathbf{c}^{p-q}=1$ Solution:

Let's take $A$ to be the first term and $R$ to be the common ratio of the G.P.
Then according to the question, we have
$A R_{p-1}=a$
$A R_{q-1}=b$
$A R_{r-1}=c$ Then,

$$
\begin{aligned}
& a_{q-r} b_{r-p} c_{p-q} \\
& =A_{q-r} \times R(p-1)(q-\mathrm{r}) \times \mathrm{A}_{r-p} \times R(q-1)(r-p) \times A_{p-q} \times R(r-1)(p-q) \\
& =A q-r+r-p+p-q \times R(p r-p r-q+r)+(r q-r+p-p q)+(p r-p-q r+q) \\
& =A^{0} \times R^{0} \\
& =1
\end{aligned}
$$

Hence proved.
23. If the first and the $\boldsymbol{n}^{\text {th }}$ term of a G.P. are $a$ ad $b$, respectively, and if $\boldsymbol{P}$ is the product of $\boldsymbol{n}$ terms, prove that $P^{2}=(a b)^{n}$.

## Solution:

Given, the first term of the G.P is $a$ and the last term is $b$.
Thus,
The G.P. is $a, a r, a r^{2}, a r^{3}, \ldots a r^{n-1}$, where $r$ is the common ratio.
Then,

$$
\begin{align*}
b & =a r^{n-1} \quad \ldots(1)  \tag{1}\\
P & =\text { Product of } n \text { terms } \\
& =(a)(a r)\left(a r^{2}\right) \ldots\left(a r^{n-1}\right) \\
& =(a \times a \times \ldots a)\left(r \times r^{2} \times \ldots r^{n-1}\right) \\
& =a_{n} r 1+2+\ldots(n-1) \quad \ldots(2)
\end{align*}
$$

Here, $1,2, \ldots(n-1)$ is an A.P.

$$
\begin{aligned}
& \text { So, } \\
& 1+2+\ldots \ldots \ldots+(n-1)=\frac{n-1}{2}[2+(n-1-1) \times 1]=\frac{n-1}{2}[2+n-2]=\frac{n(n-1)}{2}
\end{aligned}
$$

And, the product of $n$ terms P is given by,

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

$$
\begin{aligned}
& \mathrm{P}=\mathrm{a}^{\mathrm{n}} r^{\frac{n(n-1)}{2}} \\
& \begin{aligned}
\therefore \mathrm{P}^{2} & =a^{2 n} r^{n(n-1)} \\
& =\left[a^{2} r^{(n-1)}\right]^{n} \\
& =\left[a \times a r^{n-1}\right]^{n} \\
& =(a b)^{n}
\end{aligned}
\end{aligned}
$$

$$
[\mathrm{U} \sin \mathrm{~g}(1)]
$$

24. Show that the ratio of the sum of first $\boldsymbol{n}$ terms of a G.P. to the sum of terms

$$
\text { from }(n+1)^{\text {th }} \text { to }(2 n)^{\text {th }} \text { term is } \frac{1}{r^{n}} .
$$

Solution:
Let $a$ be the first term and $r$ be the common ratio of the G.P.
Sum of first $n$ terms $=\frac{a\left(1-r^{n}\right)}{(1-r)}$
Since there are $n$ terms from $(n+1)^{\text {th }}$ to $(2 n)^{\text {th }}$ term,

Sum of terms from $(n+1)^{\text {th }}$ to $(2 n)^{\text {th }}$ term

$$
=\frac{a_{n+1}\left(1-r^{n}\right)}{(1-r)}
$$

$a_{n+1}=a r_{n+1-1}=a r_{n}$

Thus, required ratio $=$

$$
\frac{a\left(1-r^{n}\right)}{(1-r)} \times \frac{(1-r)}{a^{n}\left(1-r^{n}\right)}=\frac{1}{r^{n}}
$$

Thus, the ratio of the sum of first $n$ terms of a G.P. to the sum of terms from $(n+1)^{\text {th }}$ to $(2 n)^{\text {th }}$ term is $\frac{1}{r^{n}}$
25. If $a, b, c$ and $d$ are in G.P. show that $\left(a^{2}+b^{2}+c^{2}\right)\left(b^{2}+c^{2}+d^{2}\right)=(a b+b c+c d)^{2}$. Solution:

Given, $a, b, c, d$ are in G.P.
So, we have

$$
\begin{align*}
& b c=a d  \tag{1}\\
& b^{2}=a c  \tag{2}\\
& =b d . \tag{3}
\end{align*}
$$

Taking the R.H.S. we have R.H.S.

$$
\begin{aligned}
& =(a b+b c+c d)^{2} \\
& =(a b+a d+c d)^{2} \\
& =[a b+d(a+c)]^{2} \\
& =a^{2} b^{2}+2 a b d(a+c)+d^{2}(a+c)^{2}
\end{aligned}
$$

[Using (1)]

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

$$
\begin{aligned}
& =a^{2} b^{2}+2 a^{2} b d+2 a c b d+d^{2}\left(a^{2}+2 a c+c^{2}\right) \\
& =a^{2} b^{2}+2 a_{2}^{2} c^{2}+2 b_{2}^{2} c^{2}+d_{2}^{2} a^{2}+2 d_{2}^{2} b_{2}^{2}+d^{2} c^{2} \\
& d b+d b+d c \\
& =a_{2}^{2} b^{2}+a^{2} c^{2}+a^{2} d^{2}+b^{2} \times b^{2}+b^{2} c^{2}+b^{2} d^{2}+c^{2} b^{2}+c^{2} \times c^{2}+c^{2} d^{2}
\end{aligned} \quad \text { [Using (1) and (2)] } \quad \text { ] }
$$

[Using (2) and (3) and rearranging terms]
$=a^{2}\left(b^{2}+c^{2}+d^{2}\right)+b^{2}\left(b^{2}+c^{2}+d^{2}\right)+c^{2}\left(b^{2}+c^{2}+d^{2}\right)$

$$
=\left(a^{2}+b^{2}+c^{2}\right)\left(b^{2}+c^{2}+d^{2}\right)=\text { L.H.S. }
$$

Thus, L.H.S. $=$ R.H.S.
Therefore,

$$
\left(a^{2}+b^{2}+c^{2}\right)\left(b^{2}+c^{2}+d^{2}\right)=(a b+b c+c d)^{2}
$$

26. Insert two numbers between 3 and 81 so that the resulting sequence is G.P. Solution:

Let's assume $G_{1}$ and $G_{2}$ to be two numbers between 3 and 81 such that the series $3, G_{1}, G_{2}, 81$ forms a G.P.

And let $a$ be the first term and $r$ be the common ratio of the G.P.
Now, we have the $1^{\text {st }}$ term as 3 and the $4^{\text {th }}$ term as 81 .
$81=(3)(r)^{3} r^{3}$
$=27$
$\therefore r=3$ (Taking real roots only)
For $r=3$,
$G_{1}=a r=(3)(3)=9$
$G_{2}=a r^{2}=(3)(3)^{2}=27$
Therefore, the two numbers which can be inserted between 3 and 81 so that the resulting sequence becomes a G.P are 9 and 27.
27. Find the value of $\boldsymbol{n}$ so that $\frac{a^{n+1}+b^{n+1}}{a^{n}+b^{n}}$ may be the geometric mean between $\boldsymbol{a}$ and $\boldsymbol{b}$. Solution:
We know that,
The G. M. of $a$ and $b$ is given by $\sqrt{ } \mathrm{ab}$. Then
from the question, we have

$$
\frac{a^{n+1}+b^{n+1}}{a^{n}+b^{n}}=\sqrt{a b}
$$

By squaring both sides, we get

NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

$$
\begin{aligned}
& a^{2 n+2}+2 a^{n+1} b^{n+1}+b^{2 n+2}=(a b)\left(a^{2 n}+2 a^{n} b^{n}+b^{2 n}\right) \\
& a^{2 n+2}+2 a^{n+1} b^{n+1}+b^{2 n+2}=a^{2 n+1} b+2 a^{n+1} b^{n+1}+a b^{2 n+1} \\
& a^{2 n+2}+b^{2 n+2}=a^{2 n+1} b+a b^{2 n+1} \\
& a^{2 n+2}-a^{2 n+1} b=a b^{2 n+1}-b^{2 n+2} \\
& a^{2 n+1}(a-b)=b^{2 n+1}(a-b) \\
& \left(\frac{a}{b}\right)^{2 n+1}=1=\left(\frac{a}{b}\right)^{0} \\
& 2 n+1=0 \quad \text { (Equting the exponents) } \\
& n=\frac{-1}{2}
\end{aligned}
$$

28. The sum of two numbers is 6 times their geometric mean, show that numbers are in the ratio $(3+2 \sqrt{2}):(3-2 \sqrt{2})$.

## Solution:

Consider the two numbers be $a$ and $b$.
Then, G.M. $=\sqrt{ }$ ab.
From the question, we have

$$
\begin{align*}
& a+b=6 \sqrt{a b}  \tag{1}\\
& \Rightarrow(a+b)^{2}=36(a b)
\end{align*}
$$

Also.

$$
\begin{align*}
& (a-b)^{2}=(a+b)^{2}-4 a b=36 a b-4 a b=32 a b \\
& \Rightarrow a-b=\sqrt{32} \sqrt{a b} \\
& =4 \sqrt{2} \sqrt{a b} \tag{2}
\end{align*}
$$

On adding (1) and (2), we get

$$
\begin{aligned}
2 a & =(6+4 \sqrt{2}) \sqrt{a b} \\
a & =(3+2 \sqrt{2}) \sqrt{a b}
\end{aligned}
$$

Substiuting the value of a in (1), we get

$$
b=6 \sqrt{a b}-(3+2 \sqrt{2}) \sqrt{a b}
$$

$$
b=(3-2 \sqrt{2}) \sqrt{a b}
$$

$$
\frac{a}{b}=\frac{(3+2 \sqrt{2}) \sqrt{a b}}{(3-2 \sqrt{2}) \sqrt{a b}}=\frac{3+2 \sqrt{2}}{3-2 \sqrt{2}}
$$

Therefore, the required ratio is $(3+2 \sqrt{2}):(3-2 \sqrt{2})$

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

29. If $A$ and G be A.M. and G.M., respectively between two positive numbers, prove that the numbers are

$$
A \pm \sqrt{(A+G)(A-G)}
$$

## Solution:

Given that $A$ and $G$ are A.M. and G.M. between two positive numbers. And, let these two positive numbers be $a$ and $b$.

$$
\begin{align*}
& \text { So, }  \tag{1}\\
& \text { AM }=\mathrm{A}=\frac{\mathrm{a}+\mathrm{b}}{2} \\
& \mathrm{GM}=\mathrm{G}=\sqrt{\mathrm{ab}}
\end{align*}
$$

From (1) and (2), we get

$$
\begin{align*}
& a+b=2 A \ldots  \tag{3}\\
& a b=G^{2} \ldots \tag{4}
\end{align*}
$$

Substituting the value of $a$ and $b$ from (3) and (4) in the identity $(a-b)^{2}=(a+b)^{2}-4 a b$, we have

$$
\begin{align*}
& (a-b)^{2}=4 A^{2}-4 G^{2}=4\left(A^{2}-G^{2}\right) \\
& (a-b)^{2}=4(A+G)(A-G) \\
& (a-b)=2 \sqrt{(A+G)(A-G)} \tag{5}
\end{align*}
$$

From (3) and (5), we get

$$
\begin{aligned}
& 2 \mathrm{a}=2 \mathrm{~A}+2 \sqrt{(\mathrm{~A}+\mathrm{G})(\mathrm{A}-\mathrm{G})} \\
& \Rightarrow \mathrm{a}=\mathrm{A}+\sqrt{(\mathrm{A}+\mathrm{G})(\mathrm{A}-\mathrm{G})}
\end{aligned}
$$

Substituting the value of $a$ in (3), we have

$$
\mathrm{b}=2 \mathrm{~A}-\mathrm{A}-\sqrt{(\mathrm{A}+\mathrm{G})(\mathrm{A}-\mathrm{G})}=\mathrm{A}-\sqrt{(\mathrm{A}+\mathrm{G})(\mathrm{A}-\mathrm{G})}
$$

Therefore, the two numbers are $\mathrm{A} \pm \sqrt{(\mathrm{A}+\mathrm{G})(\mathrm{A}-\mathrm{G})}$.
30. The number of bacteria in a certain culture doubles every hour. If there were 30 bacteria present in the culture originally, how many bacteria will be present at the end of $2^{\text {nd }}$ hour, $4^{\text {th }}$ hour and $\boldsymbol{n}^{\text {th }}$ hour? Solution:

Given, the number of bacteria doubles every hour. Hence, the number of bacteria after every hour will form a G.P.
Here we have, $a=30$ and $r=2$
So, $a_{3}=a r^{2}=(30)(2)^{2}=120$
Thus, the number of bacteria at the end of $2^{\text {nd }}$ hour will be 120 .
And, $a_{5}=a r^{4}=(30)(2)^{4}=480$
The number of bacteria at the end of $4^{\text {th }}$ hour will be 480 . $a_{n}$
$+1=a r^{n}=(30) 2^{n}$

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

Therefore, the number of bacteria at the end of $n^{\text {th }}$ hour will be $30(2)^{n}$.
31. What will Rs 500 amounts to in 10 years after its deposit in a bank which pays annual interest rate of $10 \%$ compounded annually?

## Solution:

Given,
The amount deposited in the bank is Rs 500 .
At the end of first year, amount = Rs $500(1+1 / 10)=$ Rs 500 (1.1)
At the end of $2^{\text {nd }}$ year, amount $=$ Rs 500 (1.1) (1.1)
At the end of $3^{\text {rd }}$ year, amount $=$ Rs $500(1.1)(1.1)(1.1)$ and so on.... Therefore,
The amount at the end of 10 years $=$ Rs 500 (1.1) (1.1) ... (10 times)

$$
=\text { Rs } 500(1.1)^{10}
$$

32. If A.M. and G.M. of roots of a quadratic equation are 8 and 5 , respectively, then obtain the quadratic equation.

## Solution:

Let's consider the roots of the quadratic equation to be $a$ and $b$. Then, we have

$$
\begin{align*}
& \text { A.M. }=\frac{a+b}{2}=8 \Rightarrow a+b=16  \tag{1}\\
& \text { G.M. }=\sqrt{a b}=5 \Rightarrow a b=25 \tag{2}
\end{align*}
$$

We know that,
A quadratic equation can be formed as, $x^{2}-x$
(Sum of roots) $+($ Product of roots $)=0 x^{2}-x$
$(a+b)+(a b)=0$
$x^{2}-16 x+25=0 \quad$ [Using (1) and (2)]
Therefore, the required quadratic equation is $x^{2}-16 x+25=0$

## NCERT Solutions Class 11 Mathematics

 Chapter 9: Sequences and Series
## NCERT Solutions Class 11 Mathematics <br> Chapter 9: Sequences and Series

## Exercise 9.4

Find the sum to $n$ terms of each of the series in Exercises 1 to 7 .

1. $1 \times 2+2 \times 3+3 \times 4+4 \times 5+\ldots$ Solution:

Given series is $1 \times 2+2 \times 3+3 \times 4+4 \times 5+\ldots$
It's seen that, $n^{\text {th }}$ term, $a_{n}=n(n+1)$
Then, the sum of n terms of the series can be expressed as

$$
\begin{aligned}
S_{n} & =\sum_{k=1}^{n} a_{k}=\sum_{k=1}^{n} k(k+1) \\
& =\sum_{k=1}^{n} k^{2}+\sum_{k=1}^{n} k \\
& =\frac{n(n+1)(2 n+1)}{6}+\frac{n(n+1)}{2} \\
& =\frac{n(n+1)}{2}\left(\frac{2 n+1}{3}+1\right) \\
& =\frac{n(n+1)}{2}\left(\frac{2 n+4}{3}\right) \\
& =\frac{n(n+1)(n+2)}{3}
\end{aligned}
$$

2. $1 \times 2 \times 3+2 \times 3 \times 4+3 \times 4 \times 5+\ldots$ Solution:

Given series is $1 \times 2 \times 3+2 \times 3 \times 4+3 \times 4 \times 5+\ldots$
It's seen that,
$n^{\text {th }}$ term, $a_{n}=n(n+1)(n+2)$

$$
\begin{aligned}
& =\left(n^{2}+n\right)(n+2) \\
& =n^{3}+3 n^{2}+2 n
\end{aligned}
$$

Then, the sum of n terms of the series can be expressed as

$$
\begin{aligned}
S_{n} & =\sum_{k=1}^{n} a_{k} \\
& =\sum_{k=1}^{n} k^{3}+3 \sum_{k=1}^{n} k^{2}+2 \sum_{k=1}^{n} k \\
& =\left[\frac{n(n+1)}{2}\right]^{2}+\frac{3 n(n+1)(2 n+1)}{6}+\frac{2 n(n+1)}{2} \\
& =\left[\frac{n(n+1)}{2}\right]^{2}+\frac{n(n+1)(2 n+1)}{2}+n(n+1)
\end{aligned}
$$

$$
\begin{aligned}
& =\frac{n(n+1)}{2}\left[\frac{n(n+1)}{2}+2 n+1+2\right] \\
& =\frac{n(n+1)}{2}\left[\frac{n^{2}+n+4 n+6}{2}\right] \\
& =\frac{n(n+1)}{4}\left(n^{2}+5 n+6\right) \\
& =\frac{n(n+1)}{4}\left(n^{2}+2 n+3 n+6\right) \\
& =\frac{n(n+1)[n(n+2)+3(n+2)]}{4} \\
& =\frac{n(n+1)(n+2)(n+3)}{4}
\end{aligned}
$$

3. $3 \times 1^{2}+5 \times 2^{2}+7 \times 3^{2}+\ldots$ Solution:

Given series is $3 \times 1^{2}+5 \times 2^{2}+7 \times 3^{2}+\ldots$ It's seen that,
$n^{\text {th }}$ term, $a_{n}=(2 n+1) n^{2}=2 n^{3}+n^{2}$
Then, the sum of $n$ terms of the series can be expressed as

$$
\begin{aligned}
S_{n} & =\sum_{k=1}^{n} a_{k} \\
& =\sum_{k=1}^{n}=\left(2 k^{3}+k^{2}\right)=2 \sum_{k=1}^{n} k^{3}+\sum_{k=1}^{n} k^{2} \\
& =2\left[\frac{n(n+1)}{2}\right]^{2}+\frac{n(n+1)(2 n+1)}{6} \\
& =\frac{n^{2}(n+1)}{2}+\frac{n(n+1)(2 n+1)}{6} \\
& =\frac{n(n+1)}{2}\left[n(n+1)+\frac{2 n+1}{3}\right] \\
& =\frac{n(n+1)}{2}\left[\frac{3 n^{2}+3 n+2 n+1}{3}\right] \\
& =\frac{n(n+1)}{2}\left[\frac{3 n^{2}+5 n+1}{3}\right] \\
& =\frac{n(n+1)\left(3 n^{2}+5 n+1\right)}{6}
\end{aligned}
$$

## NCERT Solutions Class 11 Mathematics <br> Chapter 9: Sequences and Series

4. Find the sum to $\boldsymbol{n}$ terms of the $\frac{1}{1 \times 2}+\frac{1}{2 \times 3}+\frac{1}{3 \times 4}+\ldots$
series Solution: series Solution:
(By partial fractions)
It's seen that,
$n^{\text {th }}$ term, $a_{n}=\frac{1}{n(n+1)}=\frac{1}{n}-\frac{1}{n+1}$
$a_{1}=\frac{1}{1}-\frac{1}{2}$
$a_{2}=\frac{1}{2}-\frac{1}{3}$
$a_{3}=\frac{1}{3}-\frac{1}{4} \ldots$
$a_{n}=\frac{1}{n}-\frac{1}{n+1}$
On adding the above terms column wise, we get
$a_{1}+a_{2}+\ldots+a_{n}=\left[\frac{1}{1}+\frac{1}{2}+\frac{1}{3}+\ldots \frac{1}{n}\right]-\left[\frac{1}{2}+\frac{1}{3}+\frac{1}{4}+\ldots \frac{1}{n+1}\right]$
$\therefore S_{n}=1-\frac{1}{n+1}=\frac{n+1-1}{n+1}=\frac{n}{n+1}$
5. Find the sum to $n$ terms of the series $5^{2}+6^{2}+\mathbf{7}^{2}+\ldots+\mathbf{2 0}^{2}$

Solution:

Given series is $5^{2}+6^{2}+7^{2}+\ldots+20^{2}$ It's seen that,
$n^{\text {th }}$ term, $a_{n}=(n+4)^{2}=n^{2}+8 n+16$
Then, the sum of $n$ terms of the series can be expressed as

## NCERT Solutions Class 11 Mathematics <br> Chapter 9: Sequences and Series

$$
\begin{aligned}
S_{n} & =\sum_{k=1}^{n} a_{k}=\sum_{k=1}^{n}\left(k^{2}+8 k+16\right) \\
& =\sum_{k=1}^{n} k^{2}+8 \sum_{k=1}^{n} k+\sum_{k=1}^{n} 16 \\
& =\frac{n(n+1)(2 n+1)}{6}+\frac{8 n(n+1)}{2}+16 n
\end{aligned}
$$

Now. its found that $16^{\text {th }}$ term is $(16+4)^{2}=20^{2}$
Thus,

$$
\begin{aligned}
& S_{10}=\frac{16(16+1)(2 \times 16+1)}{6}+\frac{8 \times 16 \times(16+1)}{2}+16 \times 16 \\
& =\frac{(16)(17)(33)}{6}+\frac{(8) \times 16 \times(16+1)}{2}+16 \times 16 \\
& =\frac{(16)(17)(33)}{6}+\frac{(8)(16)(17)}{2}+256 \\
& =1496+1088+256 \\
& =2840 \\
& \text { Hence, } 5^{2}+6^{2}+7^{2}+\ldots \ldots . .+20^{2}=2840
\end{aligned}
$$

6. Find the sum to $n$ terms of the series $3 \times 8+6 \times 11+9 \times 14+\ldots$

Solution:

Given series is $3 \times 8+6 \times 11+9 \times 14+\ldots$
It's found out that,
$a_{n}=\left(n^{\text {th }}\right.$ term of $\left.3,6,9 \ldots\right) \times\left(n^{\text {th }}\right.$ term of $\left.8,11,14, \ldots\right)$
$=(3 n)(3 n+5)$
$=9 n^{2}+15 n$
Then, the sum of n terms of the series can be expressed as

$$
\begin{aligned}
S_{n} & =\sum_{k=1}^{n} a_{k}=\sum_{k=1}^{n}\left(9 k^{2}+15 k\right) \\
& =9 \sum_{k=1}^{n} k^{2}+15 \sum_{k=1}^{n} k \\
& =9 \times \frac{n(n+1)(2 n+1)}{6}+15 \times \frac{n(n+1)}{2} \\
& =\frac{3 n(n+1)(2 n+1)}{2}+\frac{15 n(n+1)}{2} \\
& =\frac{3 n(n+1)}{2}(2 n+1+5) \\
& =\frac{3 n(n+1)}{2}(2 n+6) \\
& =3 n(n+1)(n+3)
\end{aligned}
$$

7. Find the sum to $n$ terms of the series $\mathbf{1}^{2}+\left(1^{2}+2^{2}\right)+\left(1^{2}+2^{2}\right.$ $+3^{2}$ ) + ... Solution:

Given series is $1^{2}+\left(1^{2}+2^{2}\right)+\left(1^{2}+2^{2}+3^{2}\right)+\ldots$
Finding the $\mathrm{n}^{\text {th }}$ term, we have $a_{n}$

$$
\begin{aligned}
= & \left(1^{2}+2^{2}+3^{2}+\ldots \ldots .+n^{2}\right) \\
& =\frac{n(n+1)(2 n+1)}{6} \\
& =\frac{n\left(2 n^{2}+3 n+1\right)}{6} \\
& =\frac{2 n^{3}+3 n^{2}+n}{6} \\
& =\frac{1}{3} n^{3}+\frac{1}{2} n^{2}+\frac{1}{6} n
\end{aligned}
$$

Now, the sum of $n$ terms of the series can be expressed as

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

$$
\begin{aligned}
& S_{n}=\sum_{k=1}^{n} a_{k} \\
& =\sum_{k=1}^{n}\left(\frac{1}{3} k^{3}+\frac{1}{2} k^{2}+\frac{1}{6} k\right) \\
& =\frac{1}{3} \sum_{k=1}^{n} k^{3}+\frac{1}{2} \sum_{k=1}^{n} k^{2}+\frac{1}{6} \sum_{k=1}^{n} k \\
& =\frac{1}{3} \frac{n^{2}(n+1)^{2}}{(2)^{2}}+\frac{1}{2} \times \frac{n(n+1)(2 n+1)}{6}+\frac{1}{6} \times \frac{n(n+1)}{2} \\
& =\frac{n(n+1)}{6}\left[\frac{n(n+1)}{2}+\frac{(2 n+1)}{2}+\frac{1}{2}\right] \\
& =\frac{n(n+1)}{6}\left[\frac{n^{2}+n+2 n+1+1}{2}\right] \\
& =\frac{n(n+1)}{6}\left[\frac{n^{2}+n+2 n+2}{2}\right] \\
& =\frac{n(n+1)}{6}\left[\frac{n(n+1)+2(n+1)}{2}\right] \\
& =\frac{n(n+1)}{6}\left[\frac{(n+1)(n+2)}{2}\right] \\
& =\frac{n(n+1)^{2}}{12}(n+2)
\end{aligned}
$$

8. Find the sum to $\boldsymbol{n}$ terms of the series whose $\boldsymbol{n}^{\text {th }}$ term is given by $n(n+1)(n+4)$. Solution:

Given,
$a_{n}=n(n+1)(n+4)=n\left(n^{2}+5 n+4\right)=n^{3}+5 n^{2}+4 n$ Now, the sum of n terms of the series can be expressed as

# NCERT Solutions Class 11 Mathematics <br> Chapter 9: Sequences and Series 

$$
\begin{aligned}
S_{n} & =\sum_{k=1}^{n} a_{k}=\sum_{k=1}^{n} k^{3}+5 \sum_{k=1}^{n} k^{2}+4 \sum_{k=1}^{n} k \\
& =\frac{n^{2}(n+1)^{2}}{4}+\frac{5 n(n+1)(2 n+1)}{6}+\frac{4 n(n+1)}{2} \\
& =\frac{n(n+1)}{2}\left[\frac{n(n+1)}{2}+\frac{5(2 n+1)}{3}+4\right] \\
& =\frac{n(n+1)}{2}\left[\frac{3 n^{2}+3 n+20 n+10+24}{6}\right] \\
& =\frac{n(n+1)}{2}\left[\frac{3 n^{2}+23 n+34}{6}\right] \\
& =\frac{n(n+1)\left(3 n^{2}+23 n+34\right)}{12}
\end{aligned}
$$

9. Find the sum to $n$ terms of the series whose $n^{\text {th }}$ terms is given by $n^{2}+2^{n}$ Solution:

Given, $\mathrm{n}^{\text {th }}$ term of the
series as: $a_{n}=n^{2}+2^{n}$
Then, the sum of $n$ terms of the series can be expressed as

$$
\begin{equation*}
\mathrm{S}_{\mathrm{n}}=\sum_{\mathrm{k}=1}^{\mathrm{n}} \mathrm{k}^{2}+2^{\mathrm{k}}=\sum_{\mathrm{k}=1}^{\mathrm{n}} \mathrm{k}^{2}+\sum_{\mathrm{k}=1}^{\mathrm{n}} 2^{\mathrm{k}} \tag{1}
\end{equation*}
$$

Consider $\sum_{k=1}^{n} 2^{k}=2^{1}+2^{2}+2^{3}+\ldots$
The above series $2,2^{2}, 2^{3} \ldots$ is a G.P. with both the first term and common ratio equal to 2 .

$$
\begin{equation*}
\therefore \sum_{k=1}^{n} 2^{k}=\frac{(2)\left[(2)^{n}-1\right]}{2-1}=2\left(2^{n}-1\right) \tag{2}
\end{equation*}
$$

Therefore, from (1) and (2), we obtain

$$
S_{n}=\sum_{k=1}^{n} k^{2}+2\left(2^{n}-1\right)=\frac{n(n+1)(2 n+1)}{6}+2\left(2^{n}-1\right)
$$

10. Find the sum to $\boldsymbol{n}$ terms of the series whose $\boldsymbol{n}^{\text {th }}$ terms is given by $(2 n-1)^{2}$ Solution:

Given, $\mathrm{n}^{\text {th }}$ term of the series as:
$a_{n}=(2 n-1)^{2}=4 n^{2}-4 n+1$

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

Then, the sum of n terms of the series can be expressed as

$$
\begin{aligned}
& S_{n}=\sum_{k=1}^{n} a_{k}=\sum_{k=1}^{n}\left(4 k^{2}-4 k+1\right) \\
& =4 \sum_{k=1}^{n} k^{2}-4 \sum_{k=1}^{n} k+\sum_{k=1}^{n} 1 \\
& =\frac{4 n(n+1)(2 n+1)}{6}-\frac{4 n(n+1)}{2}+n \\
& =\frac{2 n(n+1)(2 n+1)}{3}-2 n(n+1)+n \\
& =n\left[\frac{2\left(2 n^{2}+3 n+1\right)}{3}-2(n+1)+1\right] \\
& =n\left[\frac{4 n^{2}+6 n+2-6 n-6+3}{3}\right] \\
& =n\left[\frac{4 n^{2}-1}{3}\right] \\
& =\frac{n(2 n+1)(2 n-1)}{3}
\end{aligned}
$$

NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

# NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series 

## Miscellaneous Exercise

Page No: 199

1. Show that the sum of $(m+n)^{\text {th }}$ and $(m-n)^{\text {th }}$ terms of an A.P. is equal to twice the $m^{\text {th }}$ term. Solution:

Let's take $a$ and $d$ to be the first term and the common difference of the A.P. respectively. We know that, the $k^{\text {th }}$ term of an A. P. is given by $a_{k}=a+(k-1) d$

$$
\begin{aligned}
& \text { So, } a_{m+n}=a+(m+n-1) d \\
& \text { And, } a_{m-n}=a+(m-n-1) d \\
& \begin{aligned}
& a_{m}=a+(m-1) d \text { Thus, } \\
& a_{m+n}+a_{m-n}=a+(m+n-1) d+a+(m-n-1) d \\
&=2 a+(m+n-1+m-n-1) d \\
&=2 a+(2 m-2) d \\
&=2 a+2(m-1) d \\
&=2[a+(m-1) d] \\
&=2 a_{m}
\end{aligned}
\end{aligned}
$$

Therefore, the sum of $(m+n)^{\text {th }}$ and $(m-n)^{\text {th }}$ terms of an A.P. is equal to twice the $m^{\text {th }}$ term
2. If the sum of three numbers in A.P., is 24 and their product is $\mathbf{4 4 0}$, find the numbers. Solution:

Let's consider the three numbers in A.P. as $a-d, a$, and $a+d$.
Then, from the question we have ( $a$
$-d)+(a)+(a+d)=24$
$3 a=24$
$\therefore a=8$
And,
$(a-d) a(a+d)=440$
$(8-d)(8)(8+d)=440$
$(8-d)(8+d)=55$
$64-d^{2}=55 d^{2}=$
$64-55=9$
$\therefore d= \pm 3$
Thus,
When $d=3$, the numbers are 5,8 , and 11 and When
$d=-3$, the numbers are 11,8 , and 5 .
Therefore, the three numbers are 5,8 , and 11 .
3. Let the sum of $n, 2 n, 3 n$ terms of an A.P. be $S_{1}, S_{2}$ and $S_{3}$, respectively, show that $S_{3}=$ $3\left(\mathbf{S}_{2}-\mathbf{S}_{1}\right)$ Solution:

Let's take $a$ and $d$ to be the first term and the common difference of the A.P. respectively. So, we have

NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series
$\mathrm{S}_{1}=\frac{n}{2}[2 a+(n-1) d]$
$\mathrm{S}_{2}=\frac{2 n}{2}[2 a+(2 n-1) d]=n[2 a+(2 n-1) d]$
$\mathrm{S}_{3}=\frac{3 n}{2}[2 a+(3 n-1) d]$
From (1) and (2), we get
$\mathrm{S}_{2}-\mathrm{S}_{1}=n[2 a+(2 n-1) d]-\frac{n}{2}[2 a+(n-1) d]$
$=n\left\{\frac{4 a+4 n d-2 d-2 a-n d+d}{2}\right\}$
$=n\left[\frac{2 a+3 n d-d}{2}\right]$
$=\frac{n}{2}[2 a+(3 n-1) d]$
Now,
$3\left(\mathrm{~S}_{2}-\mathrm{S}_{1}\right)=\frac{3 n}{2}[2 a+(3 n-1) d]=\mathrm{S}_{3}$
[From (3)]
Hence proved.
4. Find the sum of all numbers between 200 and 400 which are divisible by 7 . Solution:

First let's find the numbers between 200 and 400 which are divisible by 7 . The numbers are:
203, 210, 217, ... 399
Here, the first term, $a=203$
Last term, $l=399$ and
Common difference, $d=7$
Let's consider the number of terms of the A.P. to be $n$.
Hence, $a_{n}=399=a+(n-1) d$
$399=203+(n-1) 7$
$7(n-1)=196 n-1$
$=28 n=29$
Then, the sum of 29 terms of the A.P is given by:

$$
\begin{aligned}
\therefore \mathrm{S}_{29} & =\frac{29}{2}(203+399) \\
& =\frac{29}{2}(602) \\
& =(29)(301) \\
& =8729
\end{aligned}
$$

Therefore, the required sum is 8729 .

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

## 5. Find the sum of integers from 1 to 100 that are divisible by $\mathbf{2}$ or 5 . Solution:

First let's find the integers from 1 to 100 , which are divisible by 2 .
And, they are $2,4,6 \ldots 100$.
Clearly, this forms an A.P. with the first term and common difference both equal to 2 .
So, we have $100=2+(n-1) 2 n=50$
Hence, the sum is

$$
\begin{aligned}
2+4+6+\ldots+100 & =\frac{50}{2}[2(2)+(50-1)(2)] \\
& =\frac{50}{2}[4+98] \\
& =(25)(102) \\
& =2550
\end{aligned}
$$

Now, the integers from 1 to 100 , which are divisible by 5 , are $5,10 \ldots 100$.
This also forms an A.P. with the first term and common difference both equal to 5 . So, we have
$100=5+(n-1) 5$
$5 n=100 n=20$
Hence, the sum is

$$
\begin{aligned}
5+10+\ldots+100= & \frac{20}{2}[2(5)+(20-1) 5] \\
& =10[10+(19) 5] \\
& =10[10+95]=10 \times 105 \\
& =1050
\end{aligned}
$$

Lastly, the integers which are divisible by both 2 and 5 , are $10,20, \ldots 100$.
And this also forms an A.P. with the first term and common difference both equal to 10 .
So, we have
$100=10+(n-1)(10)$
$100=10 n n$
$=10$

$$
\begin{aligned}
10+20+\ldots+100 & =\frac{10}{2}[2(10)+(10-1)(10)] \\
& =5[20+90]=5(110)=550
\end{aligned}
$$

Thus, the required sum $=2550+1050-550=3050$
Therefore, the sum of the integers from 1 to 100 , which are divisible by 2 or 5 , is 3050 .
6. Find the sum of all two digit numbers which when divided by 4 , yields 1 as remainder. Solution:

We have to first find the two-digit numbers, which when divided by 4 , yield 1 as remainder. They are: $13,17, \ldots 97$.

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

As it's seen that this series forms an A.P. with first term (a) 13 and common difference (d) 4 .
Let $n$ be the number of terms of the A.P.
We know that, the $n^{\text {th }}$ term of an A.P. is given by,
$a_{n}=a+(n-1) d$ So, $97=13+(n-1)(4)$
$4(n-1)=84$
$n-1=21 n$
$=22$
Now, the sum of $n$ terms of an A.P. is given by,

$$
\begin{aligned}
& \mathrm{S}_{n}=\frac{n}{2}[2 a+(n-1) d] \\
& \begin{aligned}
\therefore \mathrm{S}_{22} & =\frac{22}{2}[22(13)+(22-1)(4)] \\
& =11[26+84] \\
& =1210
\end{aligned}
\end{aligned}
$$

Therefore, the required sum is 1210 .
7. If $\boldsymbol{f}$ is a function satisfying $\boldsymbol{f}(\boldsymbol{x}+\boldsymbol{y})=\boldsymbol{f}(\boldsymbol{x}) \boldsymbol{f}(\boldsymbol{y})$ for all $\mathbf{x}, \mathbf{y} \in \mathbf{N}$ such that $f(1)=3$ and $\sum_{x=1}^{n} \boldsymbol{f}(x)=120$ , find the value of $n$.
Solution:

Given that,
$f(x+y)=f(x) \times f(y)$ for all $x, y \in \mathrm{~N}$
(1) $=3$

Taking $x=y=1$ in (1), we have $f(1+$

1) $=f(2)=f(1) f(1)=3 \times 3=9$

Similarly,
$f(1+1+1)=f(3)=f(1+2)=f(1) f(2)=3 \times 9=27$
And, $f(4)=f(1+3)=f(1) f(3)=3 \times 27=81$
Thus, $f(1), f(2), f(3), \ldots$, that is $3,9,27, \ldots$, forms a G.P. with the first term and common ratio both equal to 3 .
We know that sum of terms in G.P is given by,

$$
S_{n}=\frac{a\left(r^{n}-1\right)}{r-1}
$$

And it's given that,

$$
\sum_{x=1}^{n} f(x)=120
$$

Hence, the sum of terms of the function is 120 .

# NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series 

$$
\begin{aligned}
& 120=\frac{3\left(3^{n}-1\right)}{3-1} \\
& 120=\frac{3}{2}\left(3^{n}-1\right) \\
& 3^{n}-1=80 \\
& 3^{n}=81=3^{4} \\
& \therefore n=4
\end{aligned}
$$

Therefore, the value of $n$ is 4 .
8. The sum of some terms of G.P. is 315 whose first term and the common ratio are 5 and 2 , respectively. Find the last term and the number of terms. Solution:

Given that the sum of some terms in a G.P is 315 . Let the number of terms be $n$.
We know that, sum of terms is

$$
\mathrm{S}_{n}=\frac{a\left(r^{n}-1\right)}{r-1}
$$

Given that the first term $a$ is 5 and common ratio $r$ is 2 .
$315=\frac{5\left(2^{n}-1\right)}{2-1}$
$2^{n}-1=63$
$2^{n}=64=(2)^{6}$
$n=6$
Hence, the last term of the G.P $=6^{\text {th }}$ term $=a r^{6-1}=(5)(2)^{5}=(5)(32)=160$ Therefore, the last term of the G.P. is 160 .
9. The first term of a G.P. is $\mathbf{1}$. The sum of the third term and fifth term is $\mathbf{9 0}$. Find the common ratio of G.P.
Solution:

Let's consider $a$ and $r$ to be the first term and the common ratio of the G.P.
respectively. Given, $a=1 a_{3}=a r^{2}=r^{2} a_{5}=a r^{4}=r^{4}$
Then, from the question we have
$r^{2}+r^{4}=90 r^{4}$
$+r^{2}-90=0$
$r^{2}=\frac{-1+\sqrt{1+360}}{2}=\frac{-1 \pm \sqrt{361}}{2}=\frac{-1 \pm 19}{2}=-10$ or 9
$\therefore r= \pm 3$
(Taking real roots)

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

Therefore, the common ratio of the G.P. is $\pm 3$.
10. The sum of three numbers in G.P. is 56 . If we subtract $\mathbf{1 , 7 , 2 1}$ from these numbers in that order, we obtain an arithmetic progression. Find the numbers. Solution:

Let's consider the three numbers in G.P. to be as $a, a r$, and $a r^{2}$.
Then from the question, we have $a+a r+a r^{2}=56 a(1+r+$ $\left.r^{2}\right)=56$
$\Rightarrow a=\frac{56}{1+r+r^{2}}$
Also, given $a-1$, $a r-7, a r^{2}-21$ forms an
A.P. So, $(a r-7)-(a-1)=\left(a r^{2}-21\right)-$
$(a r-7) a r-a-6=a r^{2}-a r-14 a r^{2}-2 a r$
$+a=8 a r^{2}-a r-a r+a=8 a\left(r^{2}+1-2 r\right)$
$=8 a(r-1)^{2}=8 \ldots(2)$
$\Rightarrow \frac{56}{1+r+r^{2}}(r-1)^{2}=8$
[Using (1)]
$7\left(r^{2}-2 r+1\right)=1+r+r^{2}$
$7 r^{2}-14 r+7-1-r-r^{2}=0$
$6 r^{2}-15 r+6=0$
$6 r^{2}-12 r-3 r+6=0$
$6 r(r-2)-3(r-2)=0$
$(6 r-3)(r-2)=0 r=2$,
1/2
When $r=2, a=8$
When $\mathrm{r}=1 / 2, \mathrm{a}=32$
Thus,
When $r=2$, the three numbers in G.P. are 8,16 , and 32.
When $r=1 / 2$, the three numbers in G.P. are 32,16 , and 8 .
Therefore in either case, the required three numbers are 8,16 , and 32 .
11. A G.P. consists of an even number of terms. If the sum of all the terms is $\mathbf{5}$ times the sum of terms occupying odd places, then find its common ratio. Solution:

Let's consider the terms in the G.P.to be $\mathrm{T}_{1}, \mathrm{~T}_{2}, \mathrm{~T}_{3}, \mathrm{~T}_{4}, \ldots \mathrm{~T}_{2 n}$.
The number of terms $=2 n$
Then, from the question we have
$\mathrm{T}_{1}+\mathrm{T}_{2}+\mathrm{T}_{3}+\ldots+\mathrm{T}_{2 n}=5\left[\mathrm{~T}_{1}+\mathrm{T}_{3}+\ldots+\mathrm{T}_{2 n-1}\right]$
$\mathrm{T}_{1}+\mathrm{T}_{2}+\mathrm{T}_{3}+\ldots+\mathrm{T}_{2 n}-5\left[\mathrm{~T}_{1}+\mathrm{T}_{3}+\ldots+\mathrm{T}_{2 n-1}\right]=0$
$\mathrm{T}_{2}+\mathrm{T}_{4}+\ldots+\mathrm{T}_{2 n}=4\left[\mathrm{~T}_{1}+\mathrm{T}_{3}+\ldots+\mathrm{T}_{2 n-1}\right]$
Now, let the terms in G.P. be $a, a r, a r^{2}, a r^{3}, \ldots$
Then (1) becomes,

# NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series 

$\frac{\operatorname{ar}\left(r^{n}-1\right)}{r-1}=\frac{4 \times a\left(r^{n}-1\right)}{r-1}$
[Using sum of terms in G.P.]
ar $=4 \mathrm{ar}$
$=4$
Thus, the common ratio of the G.P. is 4 .
12. The sum of the first four terms of an A.P. is 56 . The sum of the last four terms is $\mathbf{1 1 2}$. If its first term is 11 , then find the number of terms.
Solution:

Let's consider the terms in A.P. to be $a, a+d, a+2 d, a+3 d, \ldots a+(n-2) d, a+(n-1) d$.
From the question, we have
Sum of first four terms $=a+(a+d)+(a+2 d)+(a+3 d)=4 a+6 d$
Sum of last four terms $=[a+(n-4) d]+[a+(n-3) d]+[a+(n-2) d]+[a+n-1) d]$

$$
=4 a+(4 n-10) d
$$

Then according to the given condition,
$4 a+6 d=56$
$4(11)+6 d=56[$ Since $a=11$ (given)]
$6 d=12 d$
$=2$
Hence, $4 a+(4 n-10) d=112$
$4(11)+(4 n-10) 2=112$
$(4 n-10) 2=68$
$4 n-10=34$
$4 n=44 n=$
11
Therefore, the number of terms of the A.P. is 11 .
13. If $\frac{a+b x}{a-b x}=\frac{b+c x}{b-c x}=\frac{c+d x}{c-d x}(x \neq 0)$, then show that $\boldsymbol{a}, \boldsymbol{b}, \boldsymbol{c}$ and $\boldsymbol{d}$ are in G.P.

Solution:

Given,

$$
\frac{a+b x}{a-b x}=\frac{b+c x}{b-c x}
$$

On cross multiplying, we have

# NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series 

$(a+b x)(b-c x)=(b+c x)(a-b x)$
$a b-a c x+b^{2} x-b c x^{2}=a b-b^{2} x+a c x-b c x^{2}$
$2 b^{2} x=2 a c x$
$b^{2}=a c$
$\frac{b}{a}=\frac{c}{b}$
Also, given $\frac{b+c x}{b-c x}=\frac{c+d x}{c-d x}$

On cross multiplying, we have
$(b+c x)(c-d x)=(b-c x)(c+d x)$
$b c-b d x+c^{2} x-c d x^{2}=b c+b d x-c^{2} x-c d x^{2}$
$2 c^{2} x=2 b d x$
$c^{2}=b d$
$\frac{c}{d}=\frac{d}{c}$
From (1) and (2), we get b/a
$=\mathrm{c} / \mathrm{b}=\mathrm{d} / \mathrm{c}$
Therefore, $\mathrm{a}, \mathrm{b}, \mathrm{c}$ and d are in G.P.
14. Let $S$ be the sum, $P$ the product and $R$ the sum of reciprocals of $\boldsymbol{n}$ terms in a G.P. Prove that $\mathbf{P}_{2} \mathbf{R}_{n}=\mathbf{S}_{n}$ Solution:

Let the terms in G.P. be $a, a r, a r^{2}, a r^{3}, \ldots a r^{n-1} \ldots$
Form the question, we have

# NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series 

$$
\begin{aligned}
& \mathrm{S}=\frac{a\left(r^{n}-1\right)}{r-1} \\
& \mathrm{P}=a^{n} \times r^{1+2+\ldots+n-1} \\
&=a^{n} r^{\frac{n(n-1)}{2}} \quad[\because \text { Sum of first } n \text { natural } \mathrm{n} \\
& \mathrm{R}=\frac{1}{a}+\frac{1}{a r}+\ldots+\frac{1}{a r^{n-1}} \\
&=\frac{r^{n-1}+r^{\prime \prime-2}+\ldots r+1}{a r^{n-1}} \\
&=\frac{1\left(r^{n}-1\right)}{(r-1)} \times \frac{1}{a r^{n-1}} \quad\left[\because 1, r, \ldots r^{n-1} \text { forms a G.P }\right] \\
&=\frac{r^{n}-1}{a r^{n-1}(r-1)} \\
& \begin{aligned}
\therefore \mathrm{P}^{2} \mathrm{R}^{n} & =a^{2 n} r^{\prime n(n-1)} \frac{\left(r^{n}-1\right)^{n}}{a^{n} r^{n(n-1)}(r-1)^{n}} \\
& =\frac{a^{n}\left(r^{n}-1\right)^{n}}{(r-1)^{n}} \\
& =\left[\frac{a\left(r^{n}-1\right)}{(r-1)}\right]^{n} \\
& =\mathrm{S}^{n}
\end{aligned}
\end{aligned}
$$

Hence, $\mathrm{P}^{2} \mathrm{R}^{n}=\mathrm{S}^{n}$
15. The $p^{\text {th }}, q^{\text {th }}$ and $r^{\text {th }}$ terms of an A.P. are $a, b, c$ respectively. Show that $(q-r) a+(r-p) b+(p-$ q) $\mathbf{c}=\mathbf{0}$ Solution:

Let's assume $t$ and $d$ to be the first term and the common difference of the A.P. respectively.
Then the $n^{\text {th }}$ term of the A.P. is given by, $a_{n}=t+(n-1) d$
Thus, $a_{p}=t+(p-1) d=a$
$\ldots$ (1) $a_{q}=t+(q-1) d=b$
... (2) $a_{r}=t+(r-1) d=c$
... (3)
On subtracting equation (2) from (1), we get
$(p-1-q+1) d=a-b$
$(\mathrm{p}-q) d=a-b$

NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

$$
\begin{equation*}
d=\frac{a-b}{p-q} \tag{4}
\end{equation*}
$$

On subtracting equation (3) from (2), we get

$$
\begin{align*}
& (\mathrm{q}-1-r+1) d=b-c \\
& (q-r) d=b-c \\
& \mathrm{~d}=\frac{\mathrm{b}-\mathrm{c}}{\mathrm{q}-\mathrm{r}} \tag{5}
\end{align*}
$$

Equating both the values of $d$ obtained in (4) and (5), we get

$$
\begin{aligned}
& \frac{a-b}{p-q}=\frac{b-c}{q-r} \\
& (a-b)(q-r)=(b-c)(p-q) \\
& a q-b q-a r+b r=b p-b q-c p+c q \\
& b p-c p+c q-a q+a r-b r=0
\end{aligned}
$$

$$
(-a q+a r)+(b p-b r)+(-c p+c q)=0
$$

(By rearranging terms)

$$
-\mathrm{a}(\mathrm{q}-\mathrm{r})-\mathrm{b}(\mathrm{r}-\mathrm{p})-\mathrm{c}(\mathrm{p}-\mathrm{q})=0 \mathrm{a}(\mathrm{q}
$$

$$
-\mathrm{r})+\mathrm{b}(\mathrm{r}-\mathrm{p})+\mathrm{c}(\mathrm{p}-\mathrm{q})=0
$$

Therefore, the given result is proved.
16. If $\boldsymbol{a}\left(\frac{1}{b}+\frac{1}{c}\right), b\left(\frac{1}{c}+\frac{1}{a}\right), c\left(\frac{1}{a}+\frac{1}{b}\right)$ are in A.P., prove that $\boldsymbol{a}, \boldsymbol{b}, \boldsymbol{c}$ are in A.P.

Solution:

Given, $a\left(\frac{1}{b}+\frac{1}{c}\right), b\left(\frac{1}{c}+\frac{1}{a}\right), c\left(\frac{1}{a}+\frac{1}{b}\right)$ are in A.P.
$b\left(\frac{1}{c}+\frac{1}{a}\right)-a\left(\frac{1}{b}+\frac{1}{c}\right)=c\left(\frac{1}{a}+\frac{1}{b}\right)-b\left(\frac{1}{c}+\frac{1}{a}\right)$
$\frac{b(a+c)}{a c}-\frac{a(b+c)}{b c}=\frac{c(a+b)}{a b}-\frac{b(a+c)}{a c}$
$\frac{b^{2} a+b^{2} c-a^{2} b-a^{2} c}{a b c}=\frac{c^{2} a+c^{2} b-b^{2} a-b^{2} c}{a b c}$
$b^{2} a-a^{2} b+b^{2} c-a^{2} c=c^{2} a-b^{2} a+c^{2} b-b^{2} c$
$a b(b-a)+c\left(b^{2}-a^{2}\right)=a\left(c^{2}-b^{2}\right)+b c(c-b)$
$a b(b-a)+c(b-a)(b+a)=a(c-b)(c+b)+b c(c-b)$
$(b-a)(a b+c b+c a)=(c-b)(a c+a b+b c)$
$b-a=c-b$
Therefore, $\mathrm{a}, \mathrm{b}$ and c are in A.P.

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

17. If $a, b, c, d$ are in G.P, prove that $\left(a^{n}+b^{n}\right),\left(b^{n}+c^{n}\right),\left(c^{n}+d^{n}\right)$ are in G.P. Solution:

Given, $a, b, c$, and $d$ are in G.P.
So, we have :
$b^{2}=a c$
$c^{2}=b d \ldots$ (ii) $a d$
$=b c$
Required to prove $\left(a^{n}+b^{n}\right),\left(b^{n}+c^{n}\right),\left(c^{n}+d^{n}\right)$ are in G.P. i.e.,
$\left(b^{n}+c^{n}\right)^{2}=\left(a^{n}+b^{n}\right)\left(c^{n}+d^{n}\right)$ Taking
L.H.S.
$\left(b^{n}+c^{n}\right)^{2}=b^{2 n}+2 b^{n} c^{n}+c^{2 n}$
$=\left(b^{2}\right)^{n}+2 b^{n} c^{n}+\left(c^{2}\right)^{n}$
$=(a c)^{n}+2 b^{n} c^{n}+(b d)^{n} \quad[$ Using (i) and (ii)]
$=a^{n} c^{n}+b^{n} c^{n}+b^{n} c^{n}+b^{n} d^{n}$
$=a^{n} c^{n}+b^{n} c^{n}+a^{n} d^{n}+b^{n} d^{n}$ [Using (iii)]
$=c^{n}\left(a^{n}+b^{n}\right)+d^{n}\left(a^{n}+b^{n}\right)$
$=\left(a^{n}+b^{n}\right)\left(c^{n}+d^{n}\right)$
$=$ R.H.S.
Therefore, $\left(a^{n}+b^{n}\right),\left(b^{n}+c^{n}\right)$, and $\left(c^{n}+d^{n}\right)$ are in G.P -
Hence proved.
18. If $a$ and $b$ are the roots of $x^{2}-3 x+p=0$ and $c$, dare roots of $x^{2}-12 x+q=0$, where $a, b, c, d$, form a G.P. Prove that $(q+p):(q-p)=17: 15$.
Solution:

Given, $a$ and $b$ are the roots of $x^{2}-3 x+p=0$
So, we have $a+b=3$ and $a b=p$
Also, $c$ and $d$ are the roots of $x^{2}-12 x+q=0$
So, $c+d=12$ and $c d=q$
And given $a, b, c, d$ are in G.P. Let's
take $a=x, b=x r, c=x r^{2}, d=x r^{3}$
From (i) and (ii), we get $x$
$+x r=3$
$x(1+r)=3$ And,
$x r^{2}+x r^{3}=12 x r^{2}(1$
$+r)=12$
On dividing, we get
$\frac{x r^{2}(1+r)}{x(1+r)}=\frac{12}{3}$
$r^{2}=4$
$r= \pm 2$
When $r=2, x=3 /(1+2)=3 / 3=1$ When
$\mathrm{r}=-2, \mathrm{x}=3 /(1-2)=3 /-1=-3$
Case I:
When $r=2$ and $x=1$,
$a b=x^{2} r=2 c d$
$=x^{2} r^{5}=32$
$\frac{q+p}{q-p}=\frac{32+2}{32-2}=\frac{34}{30}=\frac{17}{15}$
$(q+p):(q-p)=17: 15$
Case II:
When $r=-2, x=-3$,
$a b=x^{2} \mathrm{r}=-18 c d=$
$x^{2} r^{5}=-288$
$\frac{q+p}{q-p}=\frac{-288-18}{-288+18}=\frac{-306}{-270}=\frac{17}{15}$
$(q+p):(q-p)=17: 15$
Therefore, in both the cases, we get $(q+p):(q-p)=17: 15 \backslash$
19. The ratio of the A.M and G.M. of two positive numbers $a$ and $b$, is $\boldsymbol{m}: \boldsymbol{n}$. Show that $a: b=\left(m+\sqrt{m^{2}-n^{2}}\right):\left(m-\sqrt{m^{2}-n^{2}}\right)$.
Solution:

Let the two numbers be $a$ and $b$.
A. $M=(a+b) / 2$ and G.M. $=\sqrt{ } \mathrm{ab}$

From the question, we have

NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

$$
\begin{align*}
& \frac{a+b}{2 \sqrt{a b}}=\frac{m}{n} \\
& \frac{(a+b)^{2}}{4(a b)}=\frac{m^{2}}{n^{2}} \\
& (a+b)^{2}=\frac{4 a b m^{2}}{n^{2}} \\
& (a+b)=\frac{2 \sqrt{a b} m}{n} \tag{1}
\end{align*}
$$

By using this in identity $(a-b)^{2}=(a+b)^{2}-4 a b$, we get

$$
\begin{align*}
& (a-b)^{2}=\frac{4 a b m^{2}}{n^{2}}-4 a b=\frac{4 a b\left(m^{2}-n^{2}\right)}{n^{2}} \\
& (a-b)=\frac{2 \sqrt{a b} \sqrt{m^{2}-n^{2}}}{n} \tag{2}
\end{align*}
$$

Adding (1) and (2), we get

$$
\begin{aligned}
& 2 a=\frac{2 \sqrt{a b}}{n}\left(m+\sqrt{m^{2}-n^{2}}\right) \\
& a=\frac{\sqrt{a b}}{n}\left(m+\sqrt{m^{2}-n^{2}}\right)
\end{aligned}
$$

Substituting the value of a in (1), we get

$$
\begin{aligned}
& b=\frac{2 \sqrt{a b}}{n} m-\frac{\sqrt{a b}}{n}\left(m+\sqrt{m^{2}-n^{2}}\right) \\
&=\frac{\sqrt{a b}}{n} m-\frac{\sqrt{a b}}{n} \sqrt{m^{2}-n^{2}} \\
&=\frac{\sqrt{a b}}{n}\left(m-\sqrt{m^{2}-n^{2}}\right) \\
& \therefore a: b=\frac{a}{b}=\frac{\frac{\sqrt{a b}}{n}\left(m+\sqrt{m^{2}-n^{2}}\right)}{\frac{\sqrt{a b}}{n}\left(m-\sqrt{m^{2}-n^{2}}\right)}=\frac{\left(m+\sqrt{m^{2}-n^{2}}\right)}{\left(m-\sqrt{m^{2}-n^{2}}\right)}
\end{aligned}
$$

Therefore, $a: b=\left(m+\sqrt{m^{2}-n^{2}}\right):\left(m-\sqrt{m^{2}-n^{2}}\right)$
20. If $a, b, c$ are in A.P,; $b, c, d$ are in G.P and $1 / c, 1 / d, 1 / \mathrm{e}$ are in A.P. prove that $a, c, e$ are in G.P. Solution:

Given $a, b, c$ are in A.P.
Hence, $b-a=c-b \ldots$ (1) And,
given that $b, c, d$ are in G.P.

So, $c^{2}=b d$
Also, $1 / \mathrm{c}, 1 / \mathrm{d}, 1 / \mathrm{e}$ are in A.P.
So,
$\frac{1}{d}-\frac{1}{c}=\frac{1}{e}-\frac{1}{d}$
$\frac{2}{d}=\frac{1}{c}+\frac{1}{e}$
Now, required to prove that $a, c, e$ are in G.P. i.e., $c^{2}=a e$
From (1), we have
$2 \mathrm{~b}=\mathrm{a}+\mathrm{c} \mathrm{b}=(\mathrm{a}$
$+\mathrm{c}) / 2$
And from (2), we have
$d=c^{2} / b$
On substituting these values in (3), we get
$\frac{2 b}{c^{2}}=\frac{1}{c}+\frac{1}{e}$
$\frac{2(a+c)}{2 c^{2}}=\frac{1}{c}+\frac{1}{e}$
$\frac{a+c}{c^{2}}=\frac{e+c}{c e}$
$\frac{a+c}{c}=\frac{e+c}{e}$
$(a+c) e=(e+c) c$
$a e+c e=e c+c^{2}$
$c^{2}=a e$
Therefore, $a, c$, and $e$ are in G.P.
21. Find the sum of the following series up to $n$ terms:
(i) $5+55+555+\ldots$
(ii) $.6+.66+.666+\ldots$ Solution:
(i) Given, $5+55+555+\ldots$

Let $\mathrm{S}_{n}=5+55+555+$
up to $n$ terms

$$
\begin{aligned}
& =\frac{5}{9}[9+99+999+\ldots \text { to } n \text { terms }] \\
& =\frac{5}{9}\left[(10-1)+\left(10^{2}-1\right)+\left(10^{3}-1\right)+\ldots \text { to } \mathrm{n} \text { terms }\right] \\
& =\frac{5}{9}\left[\left(10+10^{2}+10^{3}+\ldots \mathrm{n} \text { terms }\right)-(1+1+\ldots \mathrm{n} \text { terms })\right] \\
& =\frac{5}{9}\left[\frac{10\left(10^{\mathrm{n}}-1\right)}{10-1}-\mathrm{n}\right] \\
& =\frac{5}{9}\left[\frac{10\left(10^{\mathrm{n}}-1\right)}{9}-\mathrm{n}\right] \\
& =\frac{50}{81}\left(10^{\mathrm{n}}-1\right)-\frac{5 \mathrm{n}}{9}
\end{aligned}
$$

(ii) Given, $.6+.66+.666+\ldots$

Let $S_{n}=06 .+0.66+0.666+\ldots$ up to $n$ terms
$=6[0.1+0.11+0.111+\ldots$ to $n$ terms $]$
$=\frac{6}{9}[0.9+0.99+0.999+\ldots$ to n terms $]$
$=\frac{6}{9}\left[\left(1-\frac{1}{10}\right)+\left(1-\frac{1}{10^{2}}\right)+\left(1-\frac{1}{10^{3}}\right)+\ldots\right.$ to $n$ terms $]$
$=\frac{2}{3}\left[(1+1+\ldots \mathrm{n}\right.$ terms $)-\frac{1}{10}\left(1+\frac{1}{10}+\frac{1}{10^{2}}+\ldots \mathrm{n}\right.$ terms $\left.)\right]$
$=\frac{2}{3}\left[n-\frac{1}{10}\left(\frac{1-\left(\frac{1}{10}\right)^{n}}{1-\frac{1}{10}}\right)\right]$
$=\frac{2}{3} \mathrm{n}-\frac{2}{30} \times \frac{10}{9}\left(1-10^{-\mathrm{n}}\right)$
$=\frac{2}{3} n-\frac{2}{27}\left(1-10^{-n}\right)$
22. Find the $20^{\text {th }}$ term of the series $2 \times 4+4 \times 6+6 \times 8+\ldots+n$ terms.

Solution:

NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series
Given series is $2 \times 4+4 \times 6+6 \times 8+\ldots n$ terms $\therefore$
$n^{\text {th }}$ term $=a_{n}=2 n \times(2 n+2)=4 n^{2}+4 n$
The $20^{\text {th }}$ term,
$a_{20}=4(20)^{2}+4(20)=4(400)+80=1600+80=1680$ Therefore, the $20^{\text {th }}$ term of the series is 1680 .
23. Find the sum of the first $\boldsymbol{n}$ terms of the series: $3+7+13+21+31+\ldots$ Solution:

The given series is $3+7+13+21+31+\ldots$

$$
\begin{aligned}
& \mathrm{S}=3+7+13+21+31+\ldots+a_{n-1}+a_{n} \\
& \mathrm{~S}=3+7+13+21+\ldots .+a_{n-2}+a_{n-1}+a_{n}
\end{aligned}
$$

On subtracting both the equations, we get

$$
\begin{aligned}
& \mathrm{S}-\mathrm{S}=\left[3+\left(7+13+21+31+\ldots+a_{n-1}+a_{n}\right)\right]-\left[\left(3+7+13+21+31+\ldots+a_{n-1}\right)+a_{n}\right] \\
& \mathrm{S}-\mathrm{S}=3+\left[(7-3)+(13-7)+(21-13)+\ldots+\left(a_{n}-a_{n-1}\right)\right]-a_{n} \\
& 0=3+[4+6+8+\ldots(n-1) \text { terms }]-a_{n} a_{n} \\
& =3+[4+6+8+\ldots(n-1) \text { terms }]
\end{aligned}
$$

$$
\begin{aligned}
\Rightarrow a_{n} & =3+\left(\frac{n-1}{2}\right)[2 \times 4+(n-1-1) 2] \\
& =3+\left(\frac{n-1}{2}\right)[8+(n-2) 2] \\
& =3+\frac{(n-1)}{2}(2 n+4) \\
= & 3+(n-1)(n+2) \\
= & 3+\left(n^{2}+n-2\right) \\
& =n^{2}+n+1 \\
\therefore \sum_{k=1}^{n} a_{k} & =\sum_{k=1}^{n} k^{2}+\sum_{k=1}^{n} k+\sum_{k=1}^{n} 1 \\
& =\frac{n(n+1)(2 n+1)}{6}+\frac{n(n+1)}{2}+n \\
& =n\left[\frac{(n+1)(2 n+1)+3(n+1)+6}{6}\right] \\
& =n\left[\frac{2 n^{2}+3 n+1+3 n+3+6}{6}\right] \\
& =n\left[\frac{2 n^{2}+6 n+10}{6}\right] \\
& =\frac{n}{3}\left(n^{2}+3 n+5\right)
\end{aligned}
$$

24. If $S_{1}, S_{2}, S_{3}$ are the sum of first $n$ natural numbers, their squares and their cubes, respectively, show that $\mathbf{9 S}_{\mathbf{2}}{ }^{\mathbf{2}}=\mathrm{S}_{\mathbf{3}}\left(\mathbf{1}+\mathbf{8 S} \mathrm{S}_{1}\right)$.

## Solution:

From the question, we have
$S_{1}=\frac{n(n+1)}{2}$
$\mathrm{S}_{3}=\frac{\mathrm{n}^{2}(\mathrm{n}+1)^{2}}{4}$
Here, $\mathrm{S}_{3}\left(1+8 \mathrm{~S}_{1}\right)=\frac{\mathrm{n}^{2}(\mathrm{n}+1)^{2}}{4}\left[1+\frac{8 \mathrm{n}(\mathrm{n}+1)}{2}\right]$

$$
\begin{align*}
& =\frac{\mathrm{n}^{2}(\mathrm{n}+1)^{2}}{4}\left[1+4 \mathrm{n}^{2}+4 \mathrm{n}\right] \\
& =\frac{\mathrm{n}^{2}(\mathrm{n}+1)^{2}}{4}(2 \mathrm{n}+1)^{2} \\
& =\frac{[\mathrm{n}(\mathrm{n}+1)(2 \mathrm{n}+1)]^{2}}{4} \tag{1}
\end{align*}
$$

Also, $9 \mathrm{~S}_{2}^{2}=9 \frac{[\mathrm{n}(\mathrm{n}+1)(2 \mathrm{n}+1)]^{2}}{(6)^{2}}$

$$
\begin{align*}
& =\frac{9}{36}[n(n+1)(2 n+1)]^{2} \\
& =\frac{[n(n+1)(2 n+1)]^{2}}{4} \tag{2}
\end{align*}
$$

Therefore, from (1) and (2), we have $9 S_{2}{ }^{2}=S_{3}\left(1+8 S_{1}\right)$.
25. Find the sum of the following series up to $\boldsymbol{n}$ terms: $\frac{1^{3}}{1}+\frac{1^{3}+2^{3}}{1+3}+\frac{1^{3}+2^{3}+3^{3}}{1+3+5}+\ldots$ Solution:

The $n^{\text {th }}$ term of the given series is $\frac{1^{3}+2^{3}+3^{3}+\ldots+\mathrm{n}^{3}}{1+3+5+\ldots+(2 \mathrm{n}-1)}=\frac{\left[\frac{\mathrm{n}(\mathrm{n}+1)}{2}\right]^{2}}{1+3+5+\ldots+(2 \mathrm{n}-1)}$
Here, $1,3,5, \ldots(2 n-1)$ is an A.P. with first term a, last term $(2 n-1)$ and number of terms as $n$ So,

$$
1+3+5+\ldots .+(2 n-1)=\frac{\mathrm{n}}{2}[2 \times 1+(\mathrm{n}-1) 2]=\mathrm{n}^{2}
$$

And,

$$
a_{n}=\frac{n^{2}(n+1)^{2}}{4 n^{2}}=\frac{(n+1)^{2}}{4}=\frac{1}{4} n^{2}+\frac{1}{2} n+\frac{1}{4}
$$

$$
\begin{aligned}
& \text { Thus, } \begin{aligned}
S_{n}=\sum_{\mathrm{K}=1}^{\mathrm{n}} \mathrm{a}_{\mathrm{K}} & =\sum_{\mathrm{K}=1}^{\mathrm{n}}\left(\frac{1}{4} \mathrm{~K}^{2}+\frac{1}{2} K+\frac{1}{4}\right) \\
& =\frac{1 \mathrm{n}(\mathrm{n}+1)(2 \mathrm{n}+1)}{4}+\frac{1}{2} \frac{\mathrm{n}(\mathrm{n}+1)}{2}+\frac{1}{4} \mathrm{n} \\
& =\frac{\mathrm{n}[(\mathrm{n}+1)(2 \mathrm{n}+1)+6(\mathrm{n}+1)+6]}{24} \\
& =\frac{\mathrm{n}\left[2 \mathrm{n}^{2}+3 \mathrm{n}+1+6 \mathrm{n}+6+6\right]}{24} \\
& =\frac{\mathrm{n}\left(2 \mathrm{n}^{2}+9 n+13\right)}{24}
\end{aligned}
\end{aligned}
$$

26. Show that $\frac{1 \times 2^{2}+2 \times 3^{2}+\ldots+n \times(n+1)^{2}}{1^{2} \times 2+2^{2} \times 3+\ldots+n^{2} \times(n+1)}=\frac{3 n+5}{3 n+1}$

Solution:
$n^{\text {th }}$ term of the numerator $=n(n+1)^{2}=n^{3}+2 n^{2}+n n^{\text {th }}$ term of the denominator $=n^{2}(n+1)=n^{3}+n^{2}$

$$
\frac{1 \times 2^{2}+2 \times 3^{2}+\ldots .+n \times(n+1)^{2}}{1^{2} \times 2+2^{2} \times 3+\ldots+n^{2} \times(n+1)}=\frac{\sum_{K-1}^{n} a_{k}}{\sum_{K=1}^{n} a_{K}}=\frac{\sum_{K=1}^{n}\left(K^{3}+2 K^{2}+K\right)}{\sum_{K=1}^{n}\left(K^{3}+K^{2}\right)}
$$

$$
\text { Here, } \sum_{\mathrm{K}=1}^{\mathrm{n}}\left(\mathrm{~K}^{3}+2 \mathrm{~K}^{2}+\mathrm{K}\right)
$$

$$
=\frac{\mathrm{n}^{2}(\mathrm{n}+1)^{2}}{4}+\frac{2 \mathrm{n}(\mathrm{n}+1)(2 \mathrm{n}+1)}{6}+\frac{\mathrm{n}(\mathrm{n}+1)}{2}
$$

$$
=\frac{\mathrm{n}(\mathrm{n}+1)}{2}\left[\frac{\mathrm{n}(\mathrm{n}+1)}{2}+\frac{2}{3}(2 \mathrm{n}+1)+1\right]
$$

$$
=\frac{\mathrm{n}(\mathrm{n}+1)}{2}\left[\frac{3 \mathrm{n}^{2}+3 \mathrm{n}+8 \mathrm{n}+4+6}{6}\right]
$$

$$
=\frac{\mathrm{n}(\mathrm{n}+1)}{12}\left[3 \mathrm{n}^{2}+1 \ln +10\right]
$$

$$
=\frac{n(n+1)}{12}\left[3 n^{2}+6 n+5 n+10\right]
$$

$$
=\frac{\mathrm{n}(\mathrm{n}+1)}{12}[3 \mathrm{n}(\mathrm{n}+2)+5(\mathrm{n}+2)]
$$

$$
\begin{equation*}
=\frac{\mathrm{n}(\mathrm{n}+1)(\mathrm{n}+2)(3 \mathrm{n}+5)}{12} \tag{2}
\end{equation*}
$$

# NCERT Solutions Class 11 Mathematics <br> Chapter 9: Sequences and Series 

$$
\begin{align*}
& \text { Also, } \sum_{K=1}^{n}\left(K^{3}+K^{2}\right)=\frac{n^{2}(n+1)^{2}}{4}+\frac{n(n+1)(2 n+1)}{6} \\
& =\frac{n(n+1)}{2}\left[\frac{n(n+1)}{2}+\frac{2 n+1}{3}\right] \\
& =\frac{\mathrm{n}(\mathrm{n}+1)}{2}\left[\frac{3 n^{2}+3 n+4 n+2}{6}\right] \\
& =\frac{\mathrm{n}(\mathrm{n}+1)}{12}\left[3 \mathrm{n}^{2}+7 \mathrm{n}+2\right] \\
& =\frac{\mathrm{n}(\mathrm{n}+1)}{12}\left[3 \mathrm{n}^{2}+6 \mathrm{n}+\mathrm{n}+2\right] \\
& =\frac{\mathrm{n}(\mathrm{n}+1)}{12}[3 \mathrm{n}(\mathrm{n}+2)+1(\mathrm{n}+2)] \\
& =\frac{\mathrm{n}(\mathrm{n}+1)(\mathrm{n}+2)(3 \mathrm{n}+1)}{12} \tag{3}
\end{align*}
$$

From (1), (2) and (3), we obtain
$\frac{1 \times 2^{2}+2 \times 3^{2}+\ldots+n \times(n+1)^{2}}{1^{2} \times 2+2^{2} \times 3+\ldots+n^{2} \times(n+1)}=\frac{\frac{n(n+1)(n+2)(3 n+5)}{12}}{\frac{n(n+1)(n+2)(3 n+1)}{12}}$
$=\frac{\mathrm{n}(\mathrm{n}+1)(\mathrm{n}+2)(3 \mathrm{n}+5)}{\mathrm{n}(\mathrm{n}+1)(\mathrm{n}+2)(3 \mathrm{n}+1)}=\frac{3 \mathrm{n}+5}{3 \mathrm{n}+1}$
Hence proved.
27. A farmer buys a used tractor for Rs 12000 . He pays Rs 6000 cash and agrees to pay the balance in annual installments of Rs 500 plus $\mathbf{1 2 \%}$ interest on the unpaid amount. How much will be the tractor cost him?
Solution:

Given, the farmer pays Rs 6000 in cash.
So, the unpaid amount $=$ Rs $12000-$ Rs $6000=$ Rs 6000 From the question, the interest paid annually will be
$12 \%$ of $6000,12 \%$ of $5500,12 \%$ of $5000, \ldots, 12 \%$ of 500
Hence, the total interest to be paid $=12 \%$ of $6000+12 \%$ of $5500+12 \%$ of $5000+\ldots+12 \%$ of 500

$$
\begin{aligned}
& =12 \% \text { of }(6000+5500+5000+\ldots+500) \\
& =12 \% \text { of }(500+1000+1500+\ldots+6000)
\end{aligned}
$$

It's seen that, the series $500,1000,1500 \ldots 6000$ is an A.P. with the first term and common difference both equal to 500 .

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

Let's take the number of terms of the A.P. to be $n$.
So, $6000=500+(n-1) 500$
$1+(n-1)=12$
$n=12$ Now,
The sum of the A.P $=12 / 2[2(500)+(12-1)(500)]=6[1000+5500]=6(6500)=39000$
Hence, the total interest to be paid $=12 \%$ of $(500+1000+1500+\ldots+6000)$
$=12 \%$ of $39000=$ Rs 4680
Therefore, the tractor will cost the farmer $=($ Rs $12000+$ Rs 4680$)=$ Rs 16680
28. Shamshad Ali buys a scooter for Rs $\mathbf{2 2 0 0 0}$. He pays Rs $\mathbf{4 0 0 0}$ cash and agrees to pay the balance in annual installment of Rs 1000 plus $\mathbf{1 0 \%}$ interest on the unpaid amount. How much will the scooter cost him?
Solution:

Given, Shamshad Ali buys a scooter for Rs 22000 and pays Rs 4000 in cash.
So, the unpaid amount $=$ Rs $22000-$ Rs $4000=$ Rs 18000
Form the question, it's understood that the interest paid annually is $10 \%$ of $18000,10 \%$ of $17000,10 \%$ of $16000 \ldots 10 \%$ of 1000
Hence, the total interest to be paid $=10 \%$ of $18000+10 \%$ of $17000+10 \%$ of $16000+\ldots+10 \%$ of 1000

$$
\begin{aligned}
& =10 \% \text { of }(18000+17000+16000+\ldots+1000) \\
& =10 \% \text { of }(1000+2000+3000+\ldots+18000)
\end{aligned}
$$

It's seen that, $1000,2000,3000 \ldots 18000$ forms an A.P. with first term and common difference both equal to 1000 .
Let's take the number of terms to be $n$.
So, $18000=1000+(n-1)(1000) n=$
18
Now, the sum of the A.P is given by:

$$
\begin{aligned}
\therefore 1000+2000+\ldots .+18000 & =\frac{18}{2}[2(1000)+(18-1)(1000)] \\
& =9[2000+17000] \\
& =171000
\end{aligned}
$$

Thus,
Total interest paid $=10 \%$ of $(18000+17000+16000+\ldots+1000)$

$$
=10 \% \text { of Rs } 171000=\text { Rs } 17100
$$

Therefore, the cost of scooter $=$ Rs $22000+$ Rs $17100=$ Rs 39100
29. A person writes a letter to four of his friends. He asks each one of them to copy the letter and mail to four different persons with instruction that they move the chain similarly. Assuming that the chain is not broken and that it costs 50 paise to mail one letter. Find the amount spent on the postage when $8^{\text {th }}$ set of letter is mailed.
Solution:

## NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series

It's seen that,
The numbers of letters mailed forms a G.P.: $4,4^{2}, \ldots 4^{8}$
Here, first term $=4$ and common ratio $=4$
And the number of terms $=8$
The sum of $n$ terms of a G.P. is given by:

$$
\begin{aligned}
& \mathrm{S}_{n}=\frac{a\left(r^{n}-1\right)}{r-1} \\
& \therefore \mathrm{~S}_{8}=\frac{4\left(4^{8}-1\right)}{4-1}=\frac{4(65536-1)}{3}=\frac{4(65535)}{3}=4(21845)=87380
\end{aligned}
$$

Also, given that the cost to mail one letter is 50 paisa.
Hence, Cost of mailing 87380 letters $=$ Rs $87380 \times(50 / 100)=$ Rs $43690=$ Rs 43690
Therefore, the amount spent when $8^{\text {th }}$ set of letter is mailed will be Rs 43690 .
30. A man deposited Rs 10000 in a bank at the rate of $5 \%$ simple interest annually. Find the amount in $15^{\text {th }}$ year since he deposited the amount and also calculate the total amount after 20 years. Solution:

Given, the man deposited Rs 10000 in a bank at the rate of $5 \%$ simple interest annually.
Hence, the interest in first year $=(5 / 100)$ x Rs $10000=$ Rs 500
So, Amount in $15^{\text {th }}$ year $\quad=$ Rs $10000+\underbrace{500+500+\ldots+500}_{14 \text { times }}$
$=$ Rs $10000+14 \times$ Rs 500
= Rs 10000 + Rs 7000
$=$ Rs 17000
And, the amount after 20 years $=$ Rs $10000+\underbrace{500+500+\ldots+500}_{20 \text { times }}$

$$
\begin{aligned}
& =\text { Rs } 10000+20 \times \text { Rs } 500 \\
& =\text { Rs } 10000+\text { Rs } 10000 \\
& =\text { Rs } 20000
\end{aligned}
$$

Therefore, the amount in the $15^{\text {th }}$ year is Rs 17000 and the total amount after 20 years will be Rs 20000 .
31. A manufacture r reckons that the value of a machine, which costs him Rs 15625 , will depreciate each year by $\mathbf{2 0 \%}$. Find the estimated value at the end of 5 years. Solution:

Given, the cost of machine = Rs 15625
Also, given that the machine depreciates by $20 \%$ every year.
Hence, its value after every year is $80 \%$ of the original cost i.e., $4 / 5^{\text {th }}$ of the original cost.

# NCERT Solutions Class 11 Mathematics Chapter 9: Sequences and Series 

Therefore, the value at the end of 5 years $=$

$$
15625 \times \underbrace{\frac{4}{5} \times \frac{4}{5} \times \ldots \times \frac{4}{5}}_{5 \text { times }}
$$

$$
=5 \times 1024=5120
$$

Thus, the value of the machine at the end of 5 years will be Rs 5120 .
32. 150 workers were engaged to finish a job in a certain number of days. 4 workers dropped out on second day, 4 more workers dropped out on third day and so on. It took 8 more days to finish the work. Find the number of days in which the work was completed. Solution:

Let's assume $x$ to be the number of days in which 150 workers finish the work.
Then from the question, we have
$150 x=150+146+142+\ldots(x+8)$ terms
The series $150+146+142+\ldots(x+8)$ terms is an A.P.
With first term $(\mathrm{a})=150$, common difference $(\mathrm{d})=-4$ and number of terms $(\mathrm{n})=(x+8)$
Now, finding the sum of terms:

$$
\begin{aligned}
& 150 x=\frac{(x+8)}{2}[2(150)+(x+8-1)(-4)] \\
& 150 x=(x+8)[150+(x+7)(-2)] \\
& 150 x=(x+8)(150-2 x-14) \\
& 150 x=(x+8)(136-2 x) \\
& 75 x=(x+8)(68-x) \\
& 75 x=68 x-x^{2}+544-8 x \\
& x^{2}+75 x-60 x-544=0 \\
& x^{2}+15 x-544=0 \\
& x^{2}+32 x-17 x-544=0 \\
& x(x+32)-17(x+32)=0 \\
& (x-17)(x+32)=0 \\
& x=17 \text { or } x=-32
\end{aligned}
$$

As $x$ cannot be negative. [Number of days is always a positive quantity] $x$ $=17$
Hence, the number of days in which the work should have been completed is 17 .
But, due to the dropping out of workers the number of days in which the work is completed $=(17+8)=25$
