$a_{23}=$ element in second row and third column $=5 / 2$
2. If a matrix has 24 elements, what are the possible orders it can have? What, if it has 13 elements?

## Solution:

We know that, a matrix of order mxn having mn elements.

There are 8 possible matrices having 24 elements of orders are as follows: 1 $\times 24,2 \times 12,3 \times 8,4 \times 6,24 \times 1,12 \times 2,8 \times 3,6 \times 4$.

Prime number $13=1 \times 13$ and $13 \times 1$

Again, $1 \times 13$ (Row matrix) and $13 \times 1$ (Column matrix) are 2 possible matrices whose product is 13.

We know that, a matrix of order mxn having mn elements.

There are 6 possible matrices having 18 elements of orders: 1 $\times 18,2 \times 9,3 \times 6,18 \times 1,9 \times 2,6 \times 3$.

Again, the product of 1 and 5 or 5 and 1 is 5 .

6. Find the values of $x, y$ and $z$ from the following equations:
(i) $\left[\begin{array}{ll}4 & 3 \\ x & 5\end{array}\right]=\left[\begin{array}{ll}y & z \\ 1 & 5\end{array}\right]$
(ii) $\left[\begin{array}{cc}x+y & 2 \\ 5+z & x y\end{array}\right]=\left[\begin{array}{ll}6 & 2 \\ 5 & 8\end{array}\right]$
(iii) $\left[\begin{array}{c}x+y+z \\ x+z \\ y+z\end{array}\right]=\left[\begin{array}{l}9 \\ 5 \\ 7\end{array}\right]$

## Solution:

(i)

$$
\left[\begin{array}{ll}
4 & 3 \\
x & 5
\end{array}\right]=\left[\begin{array}{ll}
y & z \\
1 & 5
\end{array}\right]
$$

Since both the matrices are equal, so their corresponding elements are also equal.
Find the value of unknowns by equating the corresponding elements.
$4=y 3$
$=\mathrm{zx}$
$=1$
(ii) Since both the matrices are equal, so their corresponding elements are also equal.

Find the value of unknowns by equating the corresponding elements.
$\left[\begin{array}{cc}x+y & 2 \\ 5+z & x y\end{array}\right]=\left[\begin{array}{ll}6 & 2 \\ 5 & 8\end{array}\right]$
$x+y=6$
$5+z=5=>z=0$
$x y=8$

From equation (1), $x=6-y$

Substitute the value of $x$ in equation (2)
$(6-y) y=8$
$6 y-y^{2}=8$
or $y^{\wedge} 2-6 y+8=0$
$(y-4)(y-2)=0$
$y=4$ or $y=2$

Put values of $y$ in equation (1), $x+y=6$, we have $x=2$ and $x=4$
Therefore, $\mathrm{x}=2, \mathrm{y}=4$ and $\mathrm{z}=0$.
(iii)

Since both the matrices are equal, so their corresponding elements are also equal.
Find the value of unknowns by equating the corresponding elements.
$\left[\begin{array}{c}x+y+z \\ x+z \\ y+z\end{array}\right]=\left[\begin{array}{l}9 \\ 5 \\ 7\end{array}\right]$
$x+y+z=9$
$x+z=5$

$$
y+z=7 \ldots \text { (3) }
$$

equation (1) - equation (2), we get
$y=4$

Equation (3): $4+z=7=>z=3$
Equation (2) : $x+3=5 \Rightarrow x=2$
Answer: $x=2, y=4$ and $z=3$
7. Find the value of $a, b, c$ and $d$ from the equation:
$\left[\begin{array}{cc}a-b & 2 a+c \\ 2 a-b & 3 c+d\end{array}\right]=\left[\begin{array}{lr}-1 & 5 \\ 0 & 13\end{array}\right]$

## Solution:

Equate the corresponding elements of the matrices:
$a-b=-1$
$2 a+c=5$
$2 a-b=0$
$3 c+d=13$

Equation (1) - Equation (3)
$-a=-1 \Rightarrow a=1$

Equation (1) $=>1-b=-1 \quad=>b=2$
Equation (2) $=>2(1)+c=5=>c=3$
Equation (4) $=>3(3)+d=13=>d=4$

Therefore, $a=1, b=2, c=3$ and $d=4$
8. $A=\left[a_{i j}\right] m \times n$ is a square matrix, if
(A) $m<n(B) m>n(C) m=n(D)$ None of these

Solution:
Option (C) is correct.
According to square matrix definition: Number of rows = number of columns ( $m=n$ )
9. Which of the given values of $x$ and $y$ make the following pair of matrices equal
$\left[\begin{array}{cc}3 x+7 & 5 \\ y+1 & 2-3 x\end{array}\right]=\left[\begin{array}{cc}0 & y-2 \\ 8 & 4\end{array}\right]$
(A) $x=\frac{-1}{3}, y=7$
(B) Not possible to find
(C) $y=7, \quad x=\frac{-2}{3}$
(D) $x=\frac{-1}{3}, y=\frac{-2}{3}$

Solution:
Option (B) is correct.
Explanation:
By equating all corresponding elements, we get
$3 x+7=0=>x=-7 / 3$
$y-2=5=>y=7$
$y+1=8 \Rightarrow y=7$
$2-3 x=4=>x=-2 / 3$
10. The number of all possible matrices of order $3 \times 3$ with each entry 0 or 1 is:
(A) 27
(B) 18
(C) 81
(D) 512 Solution:

Option ( D ) is correct.
The number of elements of $3 \times 3$ matrix is 9 .
First element, a_11 is 2 , can be 0 or 1 , similarly the number of choices for each other element is 2 .

Total possible arrangements $=2^{\wedge} 9=512$

## 6. Simplify

$$
\cos \theta\left[\begin{array}{rr}
\cos \theta & \sin \theta \\
-\sin \theta & \cos \theta
\end{array}\right]+\sin \theta\left[\begin{array}{lr}
\sin \theta & -\cos \theta \\
\cos \theta & \sin \theta
\end{array}\right]
$$

## Solution:

Simplify first matrix:

$$
\cos \theta\left[\begin{array}{rr}
\cos \theta & \sin \theta \\
-\sin \theta & \cos \theta
\end{array}\right]=\left[\begin{array}{lc}
\cos ^{2} \theta & \cos \theta \sin \theta \\
-\sin \theta \cos \theta & \cos ^{2} \theta
\end{array}\right]
$$

Simplify second matrix:

$$
\sin \theta\left[\begin{array}{rr}
\sin \theta & -\cos \theta \\
\cos \theta & \sin \theta
\end{array}\right]=\left[\begin{array}{lc}
\sin ^{2} \theta & -\sin \theta \cos \theta \\
\sin \theta \cos \theta & \sin ^{2} \theta
\end{array}\right]
$$

Add results obtained from both the matrices, we get,

$$
\left[\begin{array}{lc}
\cos ^{2} \theta+\sin ^{2} \theta & \cos \theta \sin \theta-\sin \theta \cos \theta \\
-\sin \theta \cos \theta+\sin \theta \cos \theta & \cos ^{2} \theta+\sin ^{2} \theta
\end{array}\right]
$$

We know that, $\sin ^{2} x+\cos ^{2} x=1$

$$
=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]
$$

This implies,

$$
\cos \theta\left[\begin{array}{rr}
\cos \theta & \sin \theta \\
-\sin \theta & \cos \theta
\end{array}\right]+\sin \theta\left[\begin{array}{rr}

## Solution:

(i) Add both the expressions:

$$
\begin{aligned}

$$

Subtract both the expressions:

$$

Multiply equation (2) by 3

$$

8. Find $\mathbf{X}$, if $\mathbf{Y}=\left[\begin{array}{ll}3 & 2 \\ 1 & 4\end{array}\right]$ and $\mathbf{2} \mathbf{X}+\mathbf{Y}=\left[\begin{array}{rr}1 & 0 \\ -3 & 2\end{array}\right]$

Solution:

$$
\begin{aligned}
& 2 X=\left[\begin{array}{rr}

## Solution:

Solving left hand side expression, we get

$$
2\left[\begin{array}{ll}

19. A trust fund has Rs. 30,000 that must be invested in two different types of bonds.The first bond pays 5\% interest per year, and the second bond pays 7\% interest per year. Using matrix multiplication, determine how to divide Rs.30,000 among the two types of bonds. If the trust fund must obtain an annual total interest of:
(a) Rs. 1800
(b) Rs. 2000

## Solution:

Let $x$ be the investment in first bond, then the investment in the second bond will be Rs. (30,000 - x).

Interest paid by first bond is 5\% per year and interest paid by second bond is 7\% per year.
Matrix of investment $\left[\begin{array}{ll}x & 30000-x\end{array}\right]$

Matrix of annual interest per year is
$\left[\begin{array}{c}\frac{5}{100} \\ \frac{7}{100}\end{array}\right]$

To obtain an annual total interest of Rs. 1800, we have
$\left[\begin{array}{ll}\mathrm{x} & 30000-\mathrm{x}\end{array}\right]\left[\begin{array}{c}\frac{5}{100} \\ \frac{7}{100}\end{array}\right]=1800$
$\left[\frac{5 x}{100}+\frac{7(30000-x)}{100}\right]=1800$
$\frac{210000-2 x}{100}=1800$
$210000-2 x=180000$
$x=15000$
The investment in first bond is Rs. 15,000
And investment in second bond is Rs. $(30000-15000)=$ Rs. 15,000
To obtain an annual total interest of Rs. 2000, we have
$\left[\begin{array}{ll}\mathrm{x} & 30000-\mathrm{x}\end{array}\right]\left[\begin{array}{c}\frac{5}{100} \\ \frac{7}{100}\end{array}\right]=2000$

$$
\frac{210000-2 x}{100}=2000
$$

or $x=$ Rs. 5000
The investment in first bond is Rs. 5,000
And investment in second bond is Rs. (30000-5000) = Rs. 25,000
20. The bookshop of a particular school has 10 dozen chemistry books, 8 dozen physics books, 10 dozen economics books. Their selling prices are Rs. 80, Rs. 60 and Rs. 40 each respectively. Find the total amount the bookshop will receive from selling all the books using matrix algebra. Assume $X, Y, Z, W$ and $P$ are matrices of order $2 \times n, 3 \times k, 2 \times p, n \times 3$ and $p \times k$, respectively. Choose the correct answer in Exercises 21 and 22.

## Solution:

Let the selling prices of each book as a $3 \times 1$ matrix

Total amount received by selling all books

$$

(A) $k=3, p=n$
(B) $k$ is arbitrary, $p=2$
(C) $p$ is arbitrary, $k=3$
(D) $k=2, p=3$

## Solution:

Option (A) is correct.
$P Y+W Y=P($ order of matrix, $p \times k) x Y($ order of matrix, $3 \times k)+W$ (order of matrix, $n \times k$ )
Y (order of matrix, $3 \times \mathrm{k}$ )

(A) $p \times 2$ (B) $\mathbf{2 \times n ( C )} \mathbf{n \times 3}$ (D) $p \times n$ Solution:

Option (B) is correct.
The order of matrices $X$ and $Z$ are equal, since $n=p$ The order of $7 X-5 Z$ is same as the order of $X$ and $Z$.
The order of $7 X-5 Z$ is either $2 x n$ or $2 x p$. (Given $n=p$ )

7. (i) Show that the matrix $\mathbf{A}=\left[\begin{array}{rcc}1 & -1 & 5 \\ -1 & 2 & 1 \\ 5 & 1 & 3\end{array}\right]$ is a symmetric matrix.
(ii) Show that the matrix $\mathbf{A}=\left[\begin{array}{ccc}0 & 1 & -1 \\ -1 & 0 & 1 \\ 1 & -1 & 0\end{array}\right]$ is a skew symmetric matrix.

## Solution:

According to the symmetric matrix definition: $\mathrm{A}^{\prime}=\mathrm{A}$

$$
A^{\prime}=\left[\begin{array}{rcc}
1 & -1 & 5 \\
-1 & 2 & 1 \\
5 & 1 & 3
\end{array}\right]=A
$$

A is a symmetric matrix.
(ii) According to the skew symmetric matrix definition: $\mathrm{A}^{\prime}=-\mathrm{A}$

$$
\begin{aligned}
A^{\prime}=\left[\begin{array}{rcc}
0 & 1 & -1 \\
-1 & 0 & 1 \\
1 & -1 & 0
\end{array}\right] & =\left[\begin{array}{ccc}
0 & -1 & 1 \\
1 & 0 & -1 \\
-1 & 1 & 0
\end{array}\right] \\
& =-\left[\begin{array}{rcc}
0 & 1 & -1 \\
-1 & 0 & 1 \\
1 & -1 & 0
\end{array}\right] \\
& =-\mathrm{A}
\end{aligned}
$$

A is a skew symmetric matrix.
8. For a matrix $\mathbf{A}=\left[\begin{array}{ll}1 & 5 \\ 6 & 7\end{array}\right]$ verify that:
(i) $\left(A+A^{\prime}\right)$ is a symmetric matrix.
(ii) $\left(A-A^{\prime}\right)$ is a skew symmetric matrix.

## Solution:

(i)

$$
\begin{aligned}
A & =\left[\begin{array}{ll}
1 & 5 \\
6 & 7
\end{array}\right] \\
A+A^{\prime} & =\left[\begin{array}{ll}
1 & 5 \\
6 & 7
\end{array}\right]+\left[\begin{array}{ll}
1 & 6 \\
5 & 7
\end{array}\right]=\left[\begin{array}{rr}
2 & 11 \\
11 & 14
\end{array}\right] \\
\left(A+A^{\prime}\right)^{\prime} & =\left[\begin{array}{rr}
2 & 11 \\
11 & 14
\end{array}\right]=A+A^{\prime}
\end{aligned}
$$

$\left(A+A^{\prime}\right)$ is a symmetric matrix.
(ii)

$$
\begin{aligned}
A & =\left[\begin{array}{ll}
1 & 5 \\
6 & 7
\end{array}\right] \\
A-A^{\prime} & =\left[\begin{array}{ll}
1 & 5 \\
6 & 7
\end{array}\right]-\left[\begin{array}{ll}
1 & 6 \\
5 & 7
\end{array}\right]=\left[\begin{array}{cc}
0 & -1 \\
1 & 0
\end{array}\right] \\
\left(A+A^{\prime}\right)^{\prime} & =\left[\begin{array}{cc}
0 & 1 \\
-1 & 0
\end{array}\right]=-\left(A+A^{\prime}\right)
\end{aligned}
$$

$\left(A-A^{\prime}\right)$ is a skew symmetric matrix.
9. Find $1 / 2\left(A+A^{\prime}\right)$ and $1 / 2\left(A-A^{\prime}\right)$ when $A$ is

$$
\left[\begin{array}{rrr}
0 & a & b \\
-a & 0 & c \\
-b & -c & 0
\end{array}\right]
$$

Solution:

$$
A=\left[\begin{array}{rcc}
0 & a & b \\
-a & 0 & c \\
-b & -c & 0
\end{array}\right] \text { then } A^{\prime}=\left[\begin{array}{ccc}
0 & -a & -b \\
a & 0 & -c \\
b & c & 0
\end{array}\right]
$$

Now, $A+A^{\prime}$ is

$$
\left[\begin{array}{ccc}
0 & a & b \\
-a & 0 & c \\
-b & -c & 0
\end{array}\right]+\left[\begin{array}{ccc}
0 & -a & -b \\
a & 0 & -c \\
b & c & 0
\end{array}\right]=\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right]
$$

So, $1 / 2\left(A+A^{\prime}\right)$ is

$$
\frac{1}{2}\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right]=\left[\begin{array}{lll}
0 & 0 & 0 \\
0 & 0 & 0 \\
0 & 0 & 0
\end{array}\right]
$$

Again,

$$
\begin{aligned}
& \mathrm{A}-\mathrm{A}^{\prime}=\left[\begin{array}{ccc}
0 & a & b \\
-a & 0 & c \\
-b & -c & 0
\end{array}\right]-\left[\begin{array}{ccc}
0 & -a & -b \\
a & 0 & -c \\
b & c & 0
\end{array}\right]=\left[\begin{array}{ccc}
0 & 2 a & 2 b \\
-2 a & 0 & 2 c \\
-2 b & -2 c & 0
\end{array}\right] \\
& 1 / 2\left(\mathrm{~A}-\mathrm{A}^{\prime}\right)=1 / 2\left[\begin{array}{ccc}
0 & 2 a & 2 b \\
-2 a & 0 & 2 c \\
-2 b & -2 c & 0
\end{array}\right]=\left[\begin{array}{ccc}
0 & a & b \\
-a & 0 & c \\
-b & -c & 0
\end{array}\right]
\end{aligned}
$$

(iii) $\left[\begin{array}{ccc}3 & 3 & -1 \\ -2 & -2 & 1 \\ -4 & -5 & 2\end{array}\right]$
(iv) $\left[\begin{array}{rr}1 & 5 \\ -1 & 2\end{array}\right]$

Solution:
(i)

$$
\text { Let } A=\left[\begin{array}{cc}

\end{array}\right]\right) \\
& =\left[\begin{array}{cc}

$$

And Skew symmetric matrix $=1 / 2\left(A-A^{\prime}\right)$

## Choose the correct answer in Exercises 11 and 12.

11. If $A$ and $B$ are symmetric matrices of same order, $A B-B A$ is a:
(A) Skew-symmetric matrix
(B) Symmetric matrix
(C) Zero matrix (S) Identity matrix Solution:

Option (A) is correct.
12.

If $\mathrm{A}=\left[\begin{array}{cc}\cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha\end{array}\right]$, and $\mathrm{A}+\mathrm{A}^{\prime}=\mathrm{I}$, then the value of $\alpha$ is
(A) $\frac{\pi}{6}$
(B) $\frac{\pi}{3}$
(C) $\pi$
(D) $\frac{3 \pi}{2}$

## Solution:

Option (B) is correct.

$$
\begin{aligned}
& {\left[\begin{array}{cc}
\cos \alpha & -\sin \alpha \\
\sin \alpha & \cos \alpha
\end{array}\right]+\left[\begin{array}{rr}
\cos \alpha & \sin \alpha \\
-\sin \alpha & \cos \alpha
\end{array}\right]=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]} \\
& {\left[\begin{array}{cc}
2 \cos \alpha & 0 \\
0 & 2 \cos \alpha
\end{array}\right]=\left[\begin{array}{ll}
1 & 0 \\
0 & 1
\end{array}\right]}
\end{aligned}
$$

By equating corresponding terms,

$$
\begin{gathered}
2 \cos \alpha=1 \\
\cos \alpha=\cos \frac{\pi}{3} \\
\alpha=\frac{\pi}{3}
\end{gathered}
$$

Using elementary transformations, find the inverse of each of the matrices, if it exists in Exercises 1 to 17.

Matrices $A$ and $B$ will be inverse of each other only if
(A) $A B=B A$
(B) $A B=B A=0$
(C) $A B=0, B A=I$
(D) $A B=B A=I$

Solution:
Option (A) is correct.

1. Let $\mathrm{A}=\left[\begin{array}{ll}0 & 1 \\ 0 & 0\end{array}\right]$ show that $(a I+b A)^{n}=a^{n} I+n a^{n-1} b A$ where $I$ is the identity matrix of order 2 and $\mathbf{n} \in \mathbf{N}$.

## Solution:

Use Mathematical Induction:
Step 1: Result is true for $\mathrm{n}=1$
$(a \mathrm{I}+b \mathrm{~A})^{n}=a^{n} \mathrm{I}+n a^{n-1} b \mathrm{~A}$
Step 2: Assume that result is true for $\mathrm{n}=\mathrm{k}$
So,

$$
(a \mathrm{I}+b \mathrm{~A})^{k}=a^{k} \mathrm{I}+k a^{k-1} b \mathrm{~A}
$$

Step 3: Prove that, result is true for $n=k+1$ That is,
$(a \mathrm{I}+b \mathrm{~A})^{k+1}=a^{k+1} \mathrm{I}+(k+1) a^{k} b \mathrm{~A}$
$(a \mathrm{I}+b \mathrm{~A})^{k+1}=(a \mathrm{I}+b \mathrm{~A})^{k}(a \mathrm{I}+b \mathrm{~A})$
$=\left(a^{k} \mathrm{I}+k a^{k-1} b \mathrm{~A}\right)(a \mathrm{I}+b \mathrm{~A})$
$=a^{k+1} \mathrm{I} \times \mathrm{I}+k a^{k} b \mathrm{AI}+a^{k} b \mathrm{AI}+k a^{k-1} b^{2} \mathrm{~A} . \mathrm{A}$

$$
\left[\begin{array}{llll}

\end{array}\right]\left[\begin{array}{l}
\mathbf{0} \\
\mathbf{0}
\end{array} \mathbf{0} \mathbf{0}\right]=0
$$

Here, A.A = This implies
$=a^{k+1} \mathrm{I}+(k+1) a^{z} b \mathrm{~A}$
= R.H.S.
Thus, result is true.
Therefore, $\mathrm{p}(\mathrm{n})$ is true.
2. If $\mathbf{A}=\left[\begin{array}{lll}1 & 1 & 1 \\ 1 & 1 & 1 \\ 1 & 1 & 1\end{array}\right]$, prove that $\mathbf{A}^{\wedge} \mathbf{n}=\left[\begin{array}{lll}3^{n-1} & 3^{n-1} & 3^{n-1} \\ 3^{n-1} & 3^{n-1} & 3^{n-1} \\ 3^{n-1} & 3^{n-1} & 3^{n-1}\end{array}\right], \mathbf{n} \in \mathbf{N}$

Solution:
Let us say, $p(n)=A^{\wedge} n$
Use Mathematical Induction:
Step 1: Result is true for $\mathrm{n}=1$

$$
\mathrm{p}(1)=\mathrm{A}=\left[\begin{array}{lll}
3^{0} & 3^{0} & 3^{0} \\
3^{0} & 3^{0} & 3^{0} \\
3^{0} & 3^{0} & 3^{0}
\end{array}\right]=\left[\begin{array}{lll}
1 & 1 & 1 \\
1 & 1 & 1 \\
1 & 1 & 1
\end{array}\right]
$$

Step 2: Assume that result is true for $\mathrm{n}=\mathrm{k}$
So,

$$
\begin{gathered}
\mathrm{p}(1)=\mathrm{A}=\left[\begin{array}{lll}
3^{0} & 3^{0} & 3^{0} \\
3^{0} & 3^{0} & 3^{0} \\
3^{0} & 3^{0} & 3^{0}
\end{array}\right]=\left[\begin{array}{lll}
1 & 1 & 1 \\
1 & 1 & 1 \\
1 & 1 & 1
\end{array}\right] \\
\mathrm{p}(\mathrm{k})=\mathrm{A}^{\mathrm{k}}=\left[\begin{array}{lll}
3^{k-1} & 3^{k-1} & 3^{k-1} \\
3^{k-1} & 3^{k-1} & 3^{k-1} \\
3^{k-1} & 3^{k-1} & 3^{k-1}
\end{array}\right]
\end{gathered}
$$

Step 3: Prove that, result is true for $n=k+1$ That is,

$$
\mathrm{p}(\mathrm{k}+1)=\mathrm{A}^{\mathrm{k}+1}=\left[\begin{array}{lll}
3^{k} & 3^{k} & 3^{k} \\
3^{k} & 3^{k} & 3^{k} \\
3^{k} & 3^{k} & 3^{k}
\end{array}\right]
$$

L.H.S.:

$$
A_{k+1}=A_{k} A
$$

$$
\begin{aligned}
& {\left[\begin{array}{lll}
3^{k-1} & 3^{k-1} & 3^{k-1} \\
3^{k-1} & 3^{k-1} & 3^{k-1} \\
3^{k-1} & 3^{k-1} & 3^{k-1}
\end{array}\right]\left[\begin{array}{lll}

3^{k} & 3^{k} & 3^{k}
\end{array}\right] \\
& =\text { R.H.S. }
\end{aligned}
$$

Thus, result is true.

Therefore, By Mathematical Induction $p(n)$ is true for all natural numbers.
3. If $A=\left[\begin{array}{ll}3 & -4 \\ 1 & -1\end{array}\right]$ then prove that $A^{\wedge} n=\left[\begin{array}{cc}1+2 n & -4 n \\ n & 1-2 n\end{array}\right]$ where $n$ is any positive integer.

## Solution:

Use Mathematical Induction:
Step 1: Result is true for $\mathrm{n}=1$.

$$
A^{1}=\left[\begin{array}{cc}
1+2 n & -4 n \\
n & 1-2 n
\end{array}\right]=\left[\begin{array}{ll}
3 & -4 \\
1 & -1
\end{array}\right]
$$

Step 2: Assume that result is true for $n=k$ So,

$$
\mathrm{A}^{k}=\left[\begin{array}{cc}
1+2 k & -4 k \\
k & 1-2 k
\end{array}\right]
$$

Step 3: Prove that, result is true for $n=k+1$ That is,
$\mathrm{A}^{\mathrm{k}+1}=\left[\begin{array}{cc}1+2(k+1) & -4(k+1) \\ (k+1) & 1-2(k+1)\end{array}\right]$
L.H.S.:

$$
\begin{aligned}
& \mathrm{A}^{\mathrm{k}+1}=\mathrm{A}^{\mathrm{k}} \mathrm{~A} \\
& =\left[\begin{array}{cc}
1+2(k+1) & -4(k+1) \\
(k+1) & 1-2(k+1)
\end{array}\right]\left[\begin{array}{cc}
3 & -4 \\
1 & -1
\end{array}\right]
\end{aligned}
$$

Using result from step 2.

$$
\begin{aligned}
& =\left[\begin{array}{cc}
3+6 k-4 k & -4-8 k+4 k \\
3 k+1-2 k & -4 k-1+2 k
\end{array}\right] \\
& =\left[\begin{array}{ll}
3+2 k & -4-4 k \\
1+k & -1-2 k
\end{array}\right] \\
& =\left[\begin{array}{cc}
1+2(k+1) & -4(k+1) \\
(k+1) & 1-2(k+1)
\end{array}\right] \\
& =\text { R.H.S. }
\end{aligned}
$$

Thus, result is true.
Therefore, By Mathematical Induction result is true for all positive integers.
4. If $A$ and $B$ are symmetric matrices, prove that $A B-B A$ is a skew symmetric matrix.

## Solution:

Step 1: If $A$ and $B$ are symmetric matrices, then $A^{\prime}=A$ and $B^{\prime}=B$
Step 2: $(A B-B A)^{\prime}=(A B)^{\prime}-(B A)^{\prime}$
$(A B-B A)^{\prime}=B^{\prime} A^{\prime}-A^{\prime} B^{\prime}[$ Using Reversal law]
$(A B-B A)^{\prime}=B A-A B \quad[$ Using eq. (i)]
$(A B-B A)^{\prime}=-(A B-B A)$
Therefore, $(A B-B A)$ is a skew symmetric.
5. Show that the matrix $B^{\prime} A B$ is symmetric or skew symmetric according as $A$ is symmetric or skew symmetric.

## Solution:

We know that, $(A B)^{\prime}=B^{\prime} A^{\prime}$
$\left(\mathrm{B}^{\prime} \mathrm{AB}\right)^{\prime}=\left[\mathrm{B}^{\prime}(\mathrm{AB}]^{\prime}=(\mathrm{AB})^{\prime}\left(\mathrm{B}^{\prime}\right)^{\prime}\right.$
This implies, $\left(B^{\prime} A B\right)^{\prime}=B^{\prime} A^{\prime} B$..say equation (1)
If $A$ is a symmetric matrix, then $A^{\prime}=A$

Using eq. (i) (B'AB)' = B'AB

Therefore, B'AB is a symmetric matrix.
Again,
If $A$ is a skew symmetric matrix then $A^{\prime}=-A$
Using equation (i), ( $\left.B^{\prime} A B\right)^{\prime}=B^{\prime}(-A) B=-B^{\prime} A B$
So, $\mathrm{B}^{\prime} \mathrm{AB}$ is a skew symmetric matrix.
6. Find the values of $x, y, z$ if the matrix $A=$

## Solution:

Given matrix is $\mathrm{A}=\left[\begin{array}{ccc}0 & 2 y & z \\ x & y & -z \\ x & -y & z\end{array}\right]$
Transpose of $\mathrm{A}=\mathrm{A}^{\prime}=\left[\begin{array}{ccc}0 & x & x \\ 2 y & y & -y \\ z & -z & z\end{array}\right]$
Now, A'A = I (Given)

$6 y^{2}=1 \Rightarrow y= \pm \frac{1}{\sqrt{6}}$ and

## EDUGROSS

10. A manufacturer produces three products $x, y, z$, which he sells in two markets. Annual sales are indicated below:

| Market | Products | Products | Products |
| :--- | :--- | :--- | :--- |
| I | 10,000 | 2,000 | 18,000 |
| II | 6,000 | 20,000 | 8,000 |

(a) If unit sales prices of $x, y$, and $z$ are Rs. 2.50, Rs. 1.50 and Rs. 1.00 respectively, find the total revenue in each market with the help of matrix algebra.
(b) If the unit costs of the above three commodities are Rs. 2.00, Rs. 1.00 and 50 paise respectively. Find the gross profit.

## Solution:

(a)

If unit sales prices of $x, y$, and $z$ are Rs. 2.50, Rs. 1.50 and Rs. 1.00 respectively.
Total revenue in market I and II can be shown with the help of matrix as: Basically Revenue Matrix

$$
\left[\begin{array}{ccc}
10,000 & 2,000 & 18,000 \\
6,000 & 20,000 & 8,000
\end{array}\right]\left[\begin{array}{l}
2.5 \\
1.5 \\
1
\end{array}\right]
$$

Solving above matrix, we have,

$$
\begin{aligned}
& =\left[\begin{array}{l}
25,000+3,000+18,000 \\
15,000+30,000+8,000
\end{array}\right] \\
& =\left[\begin{array}{l}
46,000 \\
53,000
\end{array}\right]
\end{aligned}
$$

## EDUGRロSS

Therefore, the total revenue in Market I = Rs. 46,000 and in Market II = Rs. 53,000.
(b) If the unit costs of the above three commodities are Rs. 2.00, Rs. 1.00 and 50 paise respectively.
Total cost prices of all the products in market I and II can be shown with the help of matrix as:
Basically Cost Matrix

$$
\left[\begin{array}{rcc}
10,000 & 2,000 & 18,000 \\
6,000 & 20,000 & 8,000
\end{array}\right]\left[\begin{array}{l}
2 \\
1 \\
0.5
\end{array}\right]
$$

Solving above matrix, we have,

$$
\begin{aligned}
& {\left[\begin{array}{l}
20,000+2,000+9,000 \\
12,000+20,000+4,000
\end{array}\right] } \\
= & {\left[\begin{array}{l}
31,000 \\
36,000
\end{array}\right] }
\end{aligned}
$$

From (a) and (b),

The profit collected in two markets is given in matrix form as
Profit matrix = Revenue matrix - Cost matrix

$$
\left[\begin{array}{l}
46,000 \\
53,000
\end{array}\right]-\left[\begin{array}{l}
31,000 \\
36,000
\end{array}\right]=\left[\begin{array}{l}
15,000 \\
17,000
\end{array}\right]
$$

Therefore, the gross profit in market I and market II = Rs. $15000+$ Rs. $17000=$ Rs. 32,000.

$a+4 b=-7$
$2 a+5 b=-8$
$3 a+6 b=-9$
$c+4 d=2$
$2 c+5 d=4$
$3 c+6 d=6$
Solving (1) and (2), we have $a=1$ and $b=-2$
Solving (4) and (5), we have $c=2$ and $d=0$

## Solution:

$A B=B A$

## EDUGRロSS

Wisdamising Knawledge

Step 2: Assume that result is true for $n=k$

Step 4: Assume that result is true for $\mathrm{n}=\mathrm{k}$
So, $(A B)^{k}=A^{k} B^{k}$

Step 3: Prove that, result is true for $n=k+1$
That is, $(A B)_{k+1}=A_{k+1} B_{k+1}$
L.H.S.: $(A B)^{k+1}=(A B)^{k}(A B)$

14. If the matrix $A$ is both symmetric and skew symmetric, then:

## (A) $A$ is a diagonal matrix

(B) $A$ is a zero matrix
(C) $A$ is a square matrix
(D) None of these

Solution:
Option (B) is correct.
15. If $A$ is a square matrix such that $A^{2}=A$, then $(I+A)^{3}-7 A$ is equal to:
(A) A
(B) I-A
(C) I
(D) 3 A

Solution:
Option (C) is correct.
Explanation:
As $A^{2}=A$
Multiplying both sides by A,

$$
A^{3}=A^{2} A=A A=A^{\wedge} 2=A
$$

Again,

$$
(I+A)^{3}-7 A=I^{3}+A^{3}+3 I^{2} A+3 I A^{2}-7 A
$$

Using $A^{2}=A$ and $A^{3}=A$, we have

$$
=1+7 A-7 A=1
$$
